METHODS OF SAMPLING AND TESTING

METHOD OF TEST FOR BULK SPECIFIC GRAVITY OF COMPACTED BITUMINOUS MIXTURES
(MODIFIED AASHTO T 166)

Changes for October, 2009:

5.1 For Method A: Suspension Method and Method C: Volumeter Method, dry the specimen to a constant mass at a temperature of 125 ± 5°F (52 ± 3°C) (Note 1). Samples saturated with water shall initially be dried overnight and then weighed at 2-hour intervals.

5.2 For Method B: Rapid Test, dry the sample by heating in an oven up to 300ºF until constant mass is achieved. (Note 5).

Note 4 - Terry cloth has been found to work well for the absorbent cloth. Damp is considered to be when no water can be wrung from the towel. Blotting the specimen with the damp towel should not exceed 5 seconds.

7.1 This procedure can be used to expedite results and is intended for specimens which are not required to be saved and which contain a substantial amount of moisture. Specimens obtained by coring or sawing can be tested the same day by this method (Note 5).

Note 5 – Specimens that have been tested according to Method B (Rapid Test) may not be used for additional testing.

9 CoreDry (InstroTek® Inc.) Drying Method:

9.1 Plug the unit into a power outlet and turn on the on/off switch. Follow the manufacturer’s recommendations for warm up and self test procedures.

9.2 Daily Test: Everyday before starting the testing operation, dry the cold trap and the specimen chamber. Run the unit without any specimens. The pressure reading on the display should be 6mm Hg. or less. If the indicated pressure is higher than 6 mm Hg. Refer to the manufacturer’s trouble shooting instructions for obtaining a proper pressure reading in the chamber.

9.3 Drying Specimens: Use a handheld infrared thermometer to ensure that the surface temperature of the specimen is between 15°C and 30°C. If the specimen is below 15°C or above 30°C, place the specimen in a room temperature environment until the surface temperature approaches the required testing temperature of 15°C to 30°C.

9.4 Immerse each specimen in water at 25 ± 1ºC (77 ± 1.8ºF) for 4 ± 1 minute and record the immersed mass as \( C \).

9.5 Remove the specimen from the water, damp-dry the specimen by blotting with a damp towel as quickly as possible (Note 4), and determine the surface-dry mass as \( B \). Any water that seeps from the specimen during the weighing operation is considered part of the saturated specimen. Each specimen shall be immersed and weighed individually.

9.6 Place the specimen on top of the specimen support plate inside the chamber.

9.7 Place the lid on the vacuum chamber and press the lid down to ensure contact between the lid and the chamber, and start the drying process.

9.8 When the specimen is dry, the unit will automatically stop. The unit is calibrated at the factory to sense a “dry specimen condition”.

9.9 Cool the specimen to room temperature at 25 ± 5ºC (77 ± 9ºF), and record the dry mass as \( A \) (Note 1).

9.10 Calculate the bulk specific gravity as given in Sections 6.5.
METHODS OF SAMPLING AND TESTING
MT 314-09

METHOD OF TEST FOR BULK SPECIFIC GRAVITY OF
COMPACTED BITUMINOUS MIXTURES
(MODIFIED AASHTO T 166)

1 Scope:
1.1 This method of test covers the determination of bulk specific gravity of specimens of compacted hot mix asphalt (HMA).
1.2 This method should not be used with samples that contain open or interconnecting voids and/or absorb more than 2 percent of water by volume, as calculated in section 6.5 or 8.6.
1.3 The bulk specific gravity of the compacted bituminous mixtures may be used in calculating the unit weight of the mixture.
1.3 The values stated in SI units are to be regarded as the standard.

2 Referenced Documents:
2.1 AASHTO:
M 231 Weighing Devices Used in the Testing of Materials
T 166 Bulk Specific Gravity of Compacted Asphalt Mixtures Using Saturated Surface-Dry Specimens
T 275 Bulk Specific Gravity of Compacted Asphalt Mixtures Using Paraffin-Coated Specimens

ASTM:
D 7227 Rapid Drying of Compacted Asphalt Specimens Using Vacuum Drying Apparatus

MT Manual:
MT-315 Bulk Specific Gravity of Compacted Asphalt Mixtures Using Paraffin-Coated Specimens

3 Terminology:
3.1 Bulk Specific Gravity (of Solids) – The ratio of the mass in air of a unit volume of a permeable material (including both permeable and impermeable voids normal to the material) at a stated temperature to the mass in air of equal density of an equal volume of gas free distilled water at a stated temperature. The form of the expression shall be:

Bulk Specific Gravity x/y °C

where:

x = temperature of the material

y = temperature of the water.

3.2 Constant mass: The mass at which further drying does not alter the mass by more than 0.05 percent when weighed at 2-hour intervals.

4 Test Specimens:
4.1 Test specimens may be either laboratory-compacted HMA or sampled from HMA pavements. The mixtures may be surface or wearing course, binder or leveling course, or hot mix-base.
4 Test Specimens: (continued)

4.2 Size of Specimens – It is recommended that: (1) the diameter of cylindrically molded or cored specimens, or the length of the sides of sawed specimens, be at least equal to four times the maximum size of the aggregate; and (2) the thickness of specimens be at least one and one-half times the maximum size of the aggregate.

4.3 Specimens shall be taken from pavements with a core drill, diamond or carborundum saw, or by other suitable means.

4.4 Care shall be taken to avoid distortion, bending, or cracking of specimens during and after the removal from the pavement or mold. Specimens shall be stored in a safe, cool place.

4.5 Specimens shall be free from foreign materials such as seal coat, tack coat, foundation material, soil, paper, or foil.

4.6 If desired, specimens may be separated from other pavement layers by sawing or other suitable means. Care should be exercised to ensure sawing does not damage the specimens.

5 Drying:

5.1 For Method A: Suspension Method and Method C: Volumeter Method, dry the specimen to a constant mass at a temperature of 125 ± 5°F (52 ± 3°C) (Note 1). Samples saturated with water shall initially be dried overnight and then weighed at 2-hour intervals.

5.2 For Method B: Rapid Test, dry the sample by heating in an oven up to 300°F until constant mass is achieved. (Note 5).

Note 1 - Constant mass is defined as the mass at which further drying at 52 ± 3°C (125 ± 5°F) does not alter the mass by more than 0.05 percent in a 2 hour drying interval. Recently molded laboratory samples, which have not been exposed to moisture, do not require drying. Core samples may be air dried in lieu of oven drying if results are proven not to differ from the oven drying method. The oven drying method is the standard and shall be used in case of dispute.

Method A: Suspension Method

6 Apparatus:

6.1 Weighing Device – The weighing device shall have sufficient capacity, be readable to 0.1 percent of the sample mass, or better, and conform to the requirements of AASHTO M 231. The weighing device shall be equipped with suitable suspension apparatus and holder to permit weighing the specimen while suspended from center of the scale pan of the weighing device.

6.2 Suspension Apparatus - The wire suspending the container shall be the smallest practical size to minimize any possible effects of a variable immersed length. The suspension apparatus shall be constructed to enable the container to be immersed to a depth sufficient to cover it and the test sample during weighing. Care should be exercised to ensure no trapped air bubbles exist under the specimen.

6.3 Water Bath - for immersing the specimen in water while suspended under the balance, equipped with an overflow outlet for maintaining a constant water level.

6.4 Procedure:

6.4.1 Cool the specimen to room temperature at 25 ± 5°C (77 ± 9°F), and record the dry mass as A (Note 1).
6.4 Procedure: (continued)

6.4.2 Immerse each specimen in water at 25 ± 1°C (77 ± 1.8°F) for 4 ± 1 minute and record the immersed mass as C.

6.4.3 Remove the specimen from the water, damp-dry the specimen by blotting with a damp towel as quickly as possible (Note 4), and determine the surface-dry mass as B. Any water that seeps from the specimen during the weighing operation is considered part of the saturated specimen. Each specimen shall be immersed and weighed individually.

Note 3 - The sequence of testing operations may be changed to expedite the test results. For example, first the immersed mass C can be taken, then the surface-dry mass B, and finally the dry-mass A.

Note 4 - Terry cloth has been found to work well for the absorbent cloth. Damp is considered to be when no water can be wrung from the towel. Blotting the specimen with the damp towel should not exceed 5 seconds.

6.5 Calculation:

6.5.1 Calculate the bulk specific gravity of the specimen as follows:

\[
\text{Bulk Specific Gravity} = \frac{A}{B - C}
\]

where:

\(A\) = mass in grams of the specimen in air,
\(B\) = mass in grams of the surface-dry specimen in air,
\(C\) = mass in grams of the specimen in water.

6.5.2 Calculate the percent of water absorbed by the specimen (on a volume basis) as follows:

\[
\text{Percent of Water Absorbed by Volume} = \frac{B - A}{B - C} \times 100
\]

6.6 If the percent of water absorbed by the specimen as calculated in section 6.5 exceeds 2.0 percent, use MT- 315 to determine the bulk specific gravity.

7 Method B: (Rapid Test)

7.1 This procedure can be used to expedite results and is intended for specimens which are not required to be saved and which contain a substantial amount of moisture. Specimens obtained by coring or sawing can be tested the same day by this method (Note 5).

7.2 The testing procedure shall be the same as in Sections 6 except for the sequence of operations. The dry mass A of the specimen is determined last as follows:

7.3 Immerse each specimen in water at 25 ± 1°C (77 ± 1.8°F) for 4 ± 1 minute and record the immersed mass as C.

7.4 Remove the specimen from the water, damp-dry the specimen by blotting with a damp towel as quickly as possible (not to exceed 5 seconds), and determine the surface-dry mass as B (Note 4). Any water that seeps from the specimen during the weighing operation is considered part of the saturated specimen. Each specimen shall be immersed and weighed individually.
7 Procedure: (continued)

7.5 Dry the sample by heating in an oven up to 300°F until constant mass is achieved (Note 5). Cool the specimen to room temperature at 25 ± 5°C (77 ± 9°F), and record the dry mass as A (Note 1).

Note 5 – Specimens that have been tested according to Method B (Rapid Test) may not be used for additional testing.

7.6 Calculations:

7.6.1 Calculate the bulk specific gravity as given in Sections 6.5.

Method C: Volumeter Method

8 Apparatus:

8.1 Weighing Device – shall have sufficient capacity, readable to 0.1 percent of the sample mass or better, and conforming to the requirements of AASHTO M 231.

8.2 Water Bath - For immersing the specimen in water.

8.3 Thermometer - ASTM 17C (17F), having a range of 19 to 27°C (66 to 80°F), graduated in 0.1°C (0.2°F) subdivisions.

8.4 Volumeter, calibrated to 1200 mL, or an appropriate capacity depending upon the size of the test sample. The volumeter shall have a tapered lid with a capillary bore.

8.5 Procedure:

8.5.1 Dry the specimen to a constant mass at a temperature of 125 ± 5°F (52 ± 3°C). Samples saturated with water shall initially be dried overnight and then weighed at 2-hour intervals. (Note 1)

8.5.2 Cool the specimen to room temperature at 25 ± 5°C (77 ± 9°F) and record the dry mass as A (Note 1).

8.5.3 Immerse the specimen in the water bath at 25 ± 1°C (77 ± 1.8°F), and let it saturate for at least 10-minutes. At the end of the 10-minute period, fill a calibrated volumeter with distilled water at 25 ± 1°C (77 ± 1.8°F), and weigh the volumeter. Designate this mass a D.

8.5.4 Remove the saturated specimen from the water bath and damp-dry the specimen by blotting with a damp towel (Note 4) as quickly as possible, weigh the specimen, and record the surface-dry mass as B. Any water that seeps from the specimen during the weighing operation is considered part of the saturated specimen.

8.5.5 Place the specimen in the volumeter, and let it stand for at least 60 seconds. Bring the temperature of the water to 25 ± 1°C (77 ± 1.8°F), and cover the volumeter, making certain that some water escapes through the capillary bore of the tapered lid. Wipe the outside of the volumeter dry with a dry absorbent cloth, and weigh the volumeter and its contents (Note 5). Record this weight as E.

Note 6 – The sequence of testing operations can be changed to expedite the test results. For example, first the mass of the saturated, damp-dry specimen B can be taken. Then the volumeter containing the saturated specimen and water E can be weighed. The dry mass of the specimen A can be determined last.
Note 7 – Method C: Volumeter Method, is not acceptable for specimens that have more than 6 percent voids.

8.6 Calculations:

8.6.1 Calculate the bulk specific gravity of the specimen as follows:

\[
\text{Bulk Specific Gravity} = \frac{A}{B + D - E}
\]

where:

- \(A\) = mass in grams of the dry specimen,
- \(B\) = mass in grams of the surface-dry specimen,
- \(D\) = mass in grams of the volumeter filled with water at 77 ± 1.8°F (25 ± 1°C), and
- \(E\) = mass in grams of the volumeter filled with the specimen and water at 25 ± 1°C (77 ± 1.8°F).

\[
\text{Percent of Water Absorbed by Volume} = \frac{B - A}{B + D - E} \times 100
\]

8.7 Calculate the percent of water absorbed by the specimen (on a volume basis) as follows:

8.8 If the percent of water absorbed by the specimen as calculated in Section 8.6 exceeds 2.0 percent, use MT-315 to determine the bulk specific gravity.

9 CoreDry (InstroTek® Inc.) Drying Method:

9.1 Plug the unit into a power outlet and turn on the on/off switch. Follow the manufacturer’s recommendations for warm up and self test procedures.

9.2 Daily Test: Everyday before starting the testing operation, dry the cold trap and the specimen chamber. Run the unit without any specimens. The pressure reading on the display should be 6mm Hg. or less. If the indicated pressure is higher than 6 mm Hg. Refer to the manufacturer’s trouble shooting instructions for obtaining a proper pressure reading in the chamber.

9.3 Drying Specimens: Use a handheld infrared thermometer to ensure that the surface temperature of the specimen is between 15°C and 30°C. If the specimen is below 15°C or above 30°C, place the specimen in a room temperature environment until the surface temperature approaches the required testing temperature of 15°C to 30°C.

9.4 Immerse each specimen in water at 25 ± 1°C (77 ± 1.8°F) for 4 ± 1 minute and record the immersed mass as \(C\).

9.5 Remove the specimen from the water, damp-dry the specimen by blotting with a damp towel as quickly as possible (Note 4), and determine the surface-dry mass as \(B\). Any water that seeps from the specimen during the weighing operation is considered part of the saturated specimen. Each specimen shall be immersed and weighed individually.

9.6 Place the specimen on top of the specimen support plate inside the chamber.

9.7 Place the lid on the vacuum chamber and press the lid down to ensure contact between the lid and the chamber, and start the drying process.

9.8 When the specimen is dry, the unit will automatically stop. The unit is calibrated at the factory to sense a “dry specimen condition”.
9  CoreDry (Instrutek® Inc.) Drying Method: (continued)

9.9  Cool the specimen to room temperature at 25 ± 5°C (77 ± 9°F), and record the dry mass as A (Note 1).

9.10 Calculate the bulk specific gravity as given in Sections 6.5.

10  Report:

10.1 The report shall include the following:

10.2 The method used (A, B, or C).

10.3 Bulk Specific Gravity reported to the nearest thousandth.

10.4 Absorption reported to the nearest hundredth.

11  Precision:

11.1 Duplicate specific gravity results by the same operator should not be considered suspect unless they differ more than 0.02.
