#### 1.0 INTRODUCTION

The McGinnis Meadows 2017 Wetland Mitigation Monitoring Report presents the results of the eighth year of post-construction monitoring at the McGinnis Meadows wetland mitigation site. This Montana Department of Transportation (MDT) wetland mitigation project is located in Section 33, Township 26 North, Range 28 West, Lincoln County, Montana, as shown in Figure 1-1. The project lies within the boundaries of Watershed #1 – Kootenai River Basin. McGinnis Meadows is located approximately 7 miles south of the US Highway 2 corridor on two parcels that encompass 33 acres of a historic hay field and pasture (Figure A-2, Appendix A). McGinnis Creek is a tributary to the Fisher River, which bisects the parcels. Figures A-2 and A-3 (Appendix A) show the monitoring activity locations and mapped site features, respectively. Figure A-4 (Appendix A) delineates the 2016 wetland credit areas. The MDT Mitigation Site Monitoring form, US Army Corps of Engineers (USACE) Wetland Determination Data forms [USACE, 2010], and the 2008 MDT Montana Wetland Assessment Method (MWAM) forms [Berglund and McEldowney, 2008] are included in Appendix B. Representative photographs are included in Appendix C, and the project plan sheet is included in Appendix D.

Wetlands that were developed at this location provide compensatory mitigation for wetland impacts associated with transportation projects in Watershed #1 – Kootenai River Basin in the Missoula District. The McGinnis Meadows site was selected after an extensive search of potential wetland and stream restoration sites by MDT within the Kootenai River Watershed in cooperation with a consortium of conservation districts known as Montana Watersheds Incorporated (MWI). The consortium consisted of the Lincoln, Sanders, and Flathead County Conservation Districts with technical assistance from the US Department of Agriculture (USDA) and Natural Resources Conservation Service (NRCS) centers in Bozeman, Kalispell, Libby, and Eureka, Montana. The wetland and stream restoration project was developed to improve the flood storage, stream length, and fisheries habitat of McGinnis Creek and to enhance the overall wildlife, riparian, and wetland habitats that are impacted by past agricultural practices within the McGinnis Creek Watershed.

Project goals include restoring/reestablishing approximately 0.8 acre of riparian habitat and 17.3 acres of degraded wetlands, creating 2.9 acres of emergent wetlands, enhancing 1.74 acres of existing emergent wetland and an intermittent drainage, preserving 0.3 acre of existing riparian communities along McGinnis Creek, and protecting 2.2 acres of upland buffer. Section 3.10 of this report presents the project credit ratios approved by the USACE under Permit #NWO-2008-03130-MTH. MDT also seeks to obtain approximately 8,835 stream credits to restore 2,850 linear feet of McGinnis Creek. The approved performance standards [MDT, 2009] are listed in Section 3.10.

Wetland Characteristics for all of the restored, created, enhanced, and preserved wetlands within the project limits will meet the parameter criteria for hydrology, vegetation, and soils established for determining wetland areas as outlined in the 1987 Corps of Engineers Wetlands Delineation Manual for the Determination of Wetlands (1987 Wetland Manual) [Environmental Laboratory, 1987] and the 2010 Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region (WMVC) (Version 2.0) (2010 Regional Supplement) [USACE, 2010].

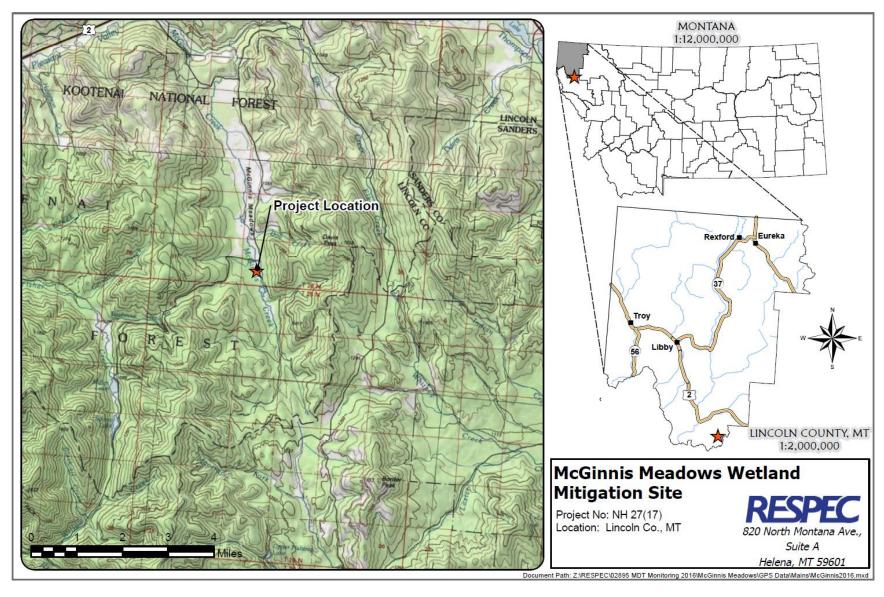

Figure 1-1. Project Location of the McGinnis Meadows Site.

- a. **Wetland Hydrology Success** will be achieved where wetland hydrology is present as per the technical guidelines in the 1987 Wetland Manual and 2010 Regional Supplement. Soil saturation will be present for at least 12.5 percent of the growing season.
- b. Hydric Soil Success will be achieved where hydric soil conditions are present (per the most recent NRCS definitions for hydric soil) or appear to be forming, the soil is sufficiently stable to prevent erosion, and the soil is able to support plant cover. Soil profile development will be documented during the course of the monitoring period to determine if wetland areas are exhibiting characteristics of hydric soils per current guidance. Because typical hydric soil indicators may require long periods to form, a lack of distinctive hydric soil features will not be considered a failure if hydrologic and vegetation success are achieved.
- c. Hydrophytic Vegetation Success will be achieved where aerial cover of facultative or wetter species is greater than or equal to 70 percent and state-listed noxious weeds do not exceed 5 percent cover. The following concept of "dominance," as defined in the 1987 Wetland Manual, will be applied during future routine wetland determinations in created/restored wetlands: "Subjectively determine the dominant species by estimating those having the largest relative basal area (woody overstory), greatest height (woody understory), greatest percentage of aerial cover (herbaceous understory), and/or greatest number of stems (woody vines)."
- d. Woody Plants and plantings will be considered successful where they exceed 50 percent survival after 5 years. The natural colonization of woody plant species from nearby sources is anticipated once the grazing, haying, and construction activities are removed from the site. The rate and extent of natural woody plant colonization will depend on factors such as habitat availability, beaver activity, seed sources, and other natural selection factors.
- 2. **Open Water** is intended to be provided by the project during the spring and early summer within excavated depressions. Open-water area will be considered creditable under this plan.
- McGinnis Creek Channel Restoration Success will be evaluated in terms of revegetation success.
  - a. Revegetation along the new McGinnis Creek channel corridor will be considered successful when banks are vegetated with a majority of deep-rooting riparian and wetland plant species.
  - b. The intent of the stream restoration is to allow the stream to migrate naturally within the floodplain and to give it enough room to move and stabilize itself within the site.
- 4. **Upland Buffer Success** will be achieved when the noxious weeds do not exceed 5 percent of cover within the buffer areas on site. Any area within the creditable buffer zone that is disturbed by project construction must have at least 50 percent aerial cover of nonweed species by the end of the monitoring period.
- 5. Weed Control will be based on annual monitoring of the site to determine weed species and the degree of infestation within the site. Control measures are based on the monitoring results and will be implemented by MDT to minimize and/or eliminate the intrusion of state-listed noxious weed species within the site. MDT is currently managing the property to control relic weed problems before wetland construction activities are initiated within the site.

6. **Fencing** on the proposed mitigation site has been installed around the perimeter of the site to protect the integrity of the wetland from disturbance. Fencing that was installed along the perimeter of the site was designed to be wildlife-friendly to allow for wildlife movement into and out of the wetland complex.

#### 2.0 METHODS

The eighth monitoring event was completed on July 24, 2017. Information collected during the field investigation was recorded on the Wetland Mitigation Site Monitoring form and Wetland Determination Data form (Appendix B). Monitoring activity locations were located with a global positioning system (GPS) (Figure A-2, Appendix A). Information collected during the site visit included a wetland delineation, vegetation community mapping, vegetation transect monitoring, soil and hydrology data, stream channel cross-sectional surveys, bird- and wildlife-use documentation, photographs, and a nonengineering examination of the infrastructure established within the mitigation project area.

#### 2.1 HYDROLOGY

The presence of hydrological indicators as outlined on the Wetland Determination Data form was assessed at two data points that were established within the project area. The hydrologic indicators were evaluated according to features observed in situ during the site visit. The data were recorded on the Wetland Determination Data forms (Appendix B). Hydrologic assessments allow mitigation goals that address inundation and saturation requirements to be evaluated.

Technical criteria for wetland hydrology guidelines have been established as "permanent or periodic inundation, or soil saturation within 12 inches of the ground surface for a significant period (12.5 percent of the growing season) during the growing season" [USACE, 2010]. Systems with continuous inundation or saturation for greater than 12.5 percent of the growing season are considered jurisdictional wetlands. The growing season is defined for purposes of this report as the number of days when a 50 percent probability exists that the minimum daily temperature is greater than or equal to 28.5 degrees Fahrenheit [USACE, 2010]. The growing season recorded for the meteorological station at Libby 32 SSE, Montana (245020), which is located approximately 20 miles northwest of the project site, extends from June 13 to September 1 for a total of 81 days. Areas that are defined as wetlands would require 10 contiguous days of inundation or saturation within 12 inches of the ground surface to meet the hydrology criteria and performance standards. Annual precipitation from January through August each year at the Libby 32 SSE (245020) meteorological station will be compared to the long-term average for this area to determine if the site is receiving above-average, below-average, or average precipitation and whether the site is experiencing drought or wet cycles.

Groundwater levels were measured in three monitoring wells across the site by US Geological Survey (USGS) staff in 2017. The well locations are shown on Figure A-2 (Appendix A).

#### 2.2 STREAM CHANNEL SURVEY

Three baseline stream cross sections were established and originally surveyed in 2010 at permanent locations marked with bank pins to assess bank stability and lateral migration throughout the monitoring period. The cross-section locations are shown on Figure A-2 (Appendix A). The stream cross sections were resurveyed from 2011 through 2017. The results of the three cross-section surveys over the 6 monitoring years are presented in Section 3.2. Winward's plant stability rating scale [Winward, 2000] was used to assess streambank stability at the three cross sections. Photographs of the cross sections from 2010 through 2017 are provided in Appendix C.

#### 2.3 VEGETATION

The boundaries of general dominant-species-based vegetation communities were determined in the field during the active growing season and subsequently delineated on the 2017 aerial photographs. The percent cover of dominant species within a community type was estimated and recorded using the following values: 0 (< 1 percent), 1 (1–5 percent), 2 (6–10 percent), 3 (11–20 percent), 4 (21–50 percent), and 5 (> 50 percent) (Appendix B). Community types were named based on the predominant vegetation species that characterized each mapped polygon (Figure A-3, Appendix A).

Temporal changes in vegetation were evaluated through annual assessments of static belt transects that were established in summer 2010 (Figure A-2, Appendix A). Vegetation composition was assessed and recorded along two vegetation belt transects approximately 10 feet wide and 504 feet and 1,000 feet long for Transects 1 and 2 (T-1 and T-2), respectively (Figure A-2, Appendix A). The transect locations were recorded with a resource-grade GPS unit. Spatial changes in the dominant vegetation communities were recorded along the stationed transect. The percent aerial cover of each vegetation species within the belt transect was estimated by using the same cover ranges listed for the community data (Appendix B). Photographs were taken at the endpoints of each transect during the monitoring event (Appendix C).

The *Montana Noxious Weed List* (February 2017), which was prepared by the Montana Department of Agriculture [2017], was used to categorize weeds identified within the site. The location of noxious weeds was noted in the field and mapped on the aerial photograph with noxious weed species color-coded (Figure A-3, Appendix A). Cover classes are represented by a T, L, M, or H, which represent less than 1 percent, 1–5 percent, 6–25 percent, and 26–100 percent, respectively. The total cover by noxious weeds overall across the site was estimated based on the noxious weed cover classes and project acreage.

#### **2.4 SOIL**

Soil information was obtained from the *Web Soil Survey for Lincoln County Area* [USDA, 2016] and soil core descriptions. Soil cores were excavated by using a Montana sharpshooter shovel and evaluated according to procedures outlined in the 1987 Wetland Manual and the 2010 Regional Supplement. A description of the soil profile, including hydric soil indicators when present, was recorded on the Wetland Determination Data form for each profile (Appendix B).

#### 2.5 WETLAND DELINEATION

Waters of the US, including special aquatic sites and jurisdictional wetlands, were delineated throughout the project area according to criteria established in the 1987 Wetland Manual and the 2010 Regional Supplement. The technical criteria for hydrophytic vegetation, hydric soil, and wetland hydrology that were described in the 2010 Regional Supplement must be satisfied to delineate a representative area as jurisdictional. The name and indicator status of plant species was derived from the 2016 National Wetland Plant List (NWPL) [Lichvar et al., 2016]. A routine, level-2, on-site determination method [Environmental Laboratory, 1987] was used to delineate jurisdictional areas within the project boundaries. The information was recorded onto the Wetland Determination Data forms (Appendix B).

The wetland boundary was determined in the field based on changes in plant communities and/or hydrology and changes in soil characteristics. Topographic relief boundaries within the project area were also examined and cross-referenced with soil and vegetation communities as supportive information for this delineation. Vegetation composition, soil characteristics, and hydrology were assessed at likely wetland and adjacent upland locations. If all three parameters met the criteria, the area was designated as wetland and mapped by vegetation community type. If any one of the parameters did not exhibit positive wetland indicators, the area was determined to be upland unless the site was classified as an atypical situation, potential problem area, or special aquatic site (i.e., mudflat). The wetland boundary was surveyed and identified on the 2017 aerial photographs. Wetland areas were calculated using GIS methods.

#### 2.6 WILDLIFE

Observations and other positive indicators of use by mammal, reptile, amphibian, and bird species were recorded on the Wetland Mitigation Site Monitoring forms during each of the site visits. Indirect-use indicators, including tracks, scat, burrows, eggshells, skins, and bones, were also recorded. These signs were recorded while traversing the site for other required activities. Direct sampling methods, such as snap traps, live traps, and pitfall traps, were not used. A comprehensive wildlife species list of animals that were observed from 2010 through 2017 was compiled for this report.

#### 2.7 FUNCTIONAL ASSESSMENT

The 2008 MDT MWAM [Berglund and McEldowney, 2008] was used to evaluate functions and values of wetlands delineated on the site from 2010 through 2017. This method provides an objective means of assigning wetlands an overall rating and provides regulators with a means of assessing mitigation success based on wetland functions. Functions are self-sustaining properties of a wetland ecosystem that exist in the absence of society and relate to ecological significance without regard to subjective human values [Berglund and McEldowney, 2008].

An MDT MWAM form was completed for each of the four assessment areas (AAs) within the McGinnis Meadows site. The AAs include Creation (excavated cells in the southeastern quadrant of the project area plus any wetland that is created outside of the Restoration, Enhancement, and Preservation credit areas), Restoration (reestablishment and rehabilitation area), Enhancement (existing emergent wetland), and Preservation (existing riverine wetlands).

#### 2.8 PHOTOGRAPHIC DOCUMENTATION

Monitoring at photo points provided supplemental information that documented wetland, upland, and transect conditions; site trends; and current land uses that surround the site. Photographs were taken at established photo points throughout the site during the site visit (Appendix C). Photo-point locations were recorded with a resource-grade GPS unit (Figure A-2, Appendix A).

#### 2.9 GLOBAL POSITIONING SYSTEM DATA

Site features and survey points were collected by using a resource-grade (± 1 meter) Trimble R1 GNSS GPS receiver and companion Android tablet during the 2017 monitoring season. The collected data were then transferred to a personal computer, imported into GIS, and projected in Montana State Plane Single Zone NAD 83 meters. Site features and survey points that were located with GPS included wetland boundaries, fence boundaries, photo points, transect endpoints, noxious weed infestations, and wetland data points.

#### 2.10 MAINTENANCE NEEDS

Channels, engineered structures, fencing, bird boxes, and other man-made features were examined during the site visit for obvious signs of breaching, damage, or other problems. This examination was cursory and did not constitute an engineering-level structural inspection.

#### 3.0 RESULTS

#### 3.1 HYDROLOGY

Climate data from the Libby 32 SSE, Montana (245020) weather station recorded an average total annual precipitation rate of 24.44 inches from 1949 to 2016 [Western Regional Climate Center, 2017]. Annual precipitation for 2010, 2011, 2012, 2013, 2014, 2015, and 2016 was 21.93, 22.64, 27.20, 19.18, 25.75, 21.26, and 21.73 inches, respectively. In general, the region that surrounds the project area exhibited below-average precipitation before and during the growing season in 2010, 2011, 2013, 2015, and 2016 and above-average precipitation in 2012 and 2014. Based on data recorded from the Libby 32 SSE, Montana station for January through August, precipitation totals for this region were 14.94 inches for the long-term average. For the past 3 years, this site reported precipitation for this same January through August period as being 11.14 inches in 2015, 10.56 inches in 2016, and 8.47 inches in 2017, which is 4–7 inches below that long-term average. The data for 2017 at this station are missing a significant number of days in January, April, and May, which likely influenced the January-to-August precipitation total. Based on field observations of hydrology within the site over the 7-year monitoring period, water levels within the excavated basins appear to be largely influenced by groundwater and stream discharge with moderate influence from direct precipitation.

The McGinnis Creek watershed is approximately 10.2 square miles in area. The creek bisects the project area. The project site was historically drained, filled, and leveled for agricultural purposes in the early to mid-20<sup>th</sup> century. The McGinnis Creek corridor was channelized during the same timeframe, which substantially altered the natural floodplain of the property. Mitigation activities included constructing a more sinuous McGinnis Creek channel. The hydrologic connection between

the creek and associated floodplain resulted in an elevated local groundwater table along the drainage. The constructed depressions were excavated to a depth that would intercept the peak seasonal groundwater elevation. Overbank flooding events recharge surface water to the depressions that were excavated within the floodplain along McGinnis Creek and throughout the site.

The average depth of surface water in areas of inundation across the site in 2017 was estimated at 0.5 foot with surface-water depths that ranged from 0 to 2 feet within the created cells. Approximately 20 percent of the entire site was inundated during the July site investigation, including the aquatic macrophytes/open-water community and McGinnis Creek. The average depth at the emergent vegetation and open-water boundary was 1 foot.

Groundwater levels were measured by the USGS on August 3, 2017, in three on-site wells located within areas that were originally delineated as wetlands in 2005 and 2006. The measurements and locations are provided in Table 3-1 and Figure A-2 (Appendix A). Groundwater elevations that were recorded in Wells 1, 2, and 3 during the July and early August 2017 monitoring were among the lowest recorded July/August groundwater depths to date at this site. Overall, the water levels that were documented from 2010 through 2016 indicate that the site has a fluctuating water table that drops well below 1 foot of the ground surface during the latter part of the growing season.

Table 3-1. Groundwater Depths Measured in Wells 1, 2, and 3 From 2010 Through 2017

Well			(fee		ater Depth ound surfa			
Number	2010	2011	2012	2013	2014	2015	2016	2017
Well 1	1.5	0.7	1.9	2.00	2.00	2.40	4.46	4.29
Well 2	3.3	2.4	2.4	3.24	2.5	3.2	3.39	3.31
Well 3	3.7	2.8	3.3	4.13	4.6	4.6	5.25	5.14

Two data points were sampled in 2017 to help define the wetland and upland boundaries (Figure A-2, Appendix A; Wetland Mitigation Site Monitoring form, Appendix B). DP-1W is located in an area that met the wetland criteria. Primary wetland hydrology indicators at DP-1W included saturation to ground level and oxidized rhizospheres along living roots. The site also had a positive FAC-neutral test. DP-1U did not display any primary or secondary indicators of wetland hydrology.

#### 3.2 MCGINNIS CREEK CHANNEL

Surface-water flow rates through the McGinnis Meadows site depend on releases from a reservoir that is located less than 1 mile south of the project site. Two 24-inch equalizing pipes and a lower culvert that serves as a drain through an impoundment control the flow rates from the reservoir. The base of the new McGinnis Creek channel was constructed at a higher elevation than the incised, abandoned channel to facilitate overbank flow from the creek and to raise groundwater elevations across the site. The fisheries habitat was improved by excavating pools in the outside channel bends. The stream banks of McGinnis Creek were minimally disturbed during construction and are currently vegetated primarily with reed canary grass (*Phalaris arundinacea*). Reed canary grass has a plant stability rating of 9; 1 is the lowest rating and 10 is the highest according to Winward's plant stability rating scale

[Winward, 2000]. The existing vegetation on the banks of the restored channel is expected to provide long-term stability and allow minimal lateral stream migration across the site.

The results of the three cross-sectional surveys that were collected over the 6 years of monitoring are presented on Charts 3-1 through 3-3. The results of the cross-sectional surveys indicate that stream adjustments occurred at the permanent monitoring locations between 2012 and 2013. A slight widening of the channel occurred at each of the three surveyed cross sections in 2013. Undercut banks had been observed at Cross-Sections 2 and 3 in previous years. The stream widening that was observed in 2013 at Cross-Sections 2 and 3 is likely caused by partial collapse of these undercut banks. Placing large trees within the stream likely contributed to the channel widening in these areas. These trees were intended to provide the functions associated with large woody debris, have increased stream velocities, and exert a corresponding increase in erosional forces on the immediately adjacent streambanks.

Since 2013, the surveyed cross sections indicated relatively stable conditions at all three monitoring locations. Movement of the streambed and banks has been minimal and is within the resolution of the measurement methodology. Overall, the banks of McGinnis Creek were well-vegetated and exhibited minimal, localized erosion only in the upper reach of the project area in 2017. Photographs of the cross sections from 2010 through 2017 are provided in Appendix C. The photographs illustrate a notable increase in the vegetation cover since construction.

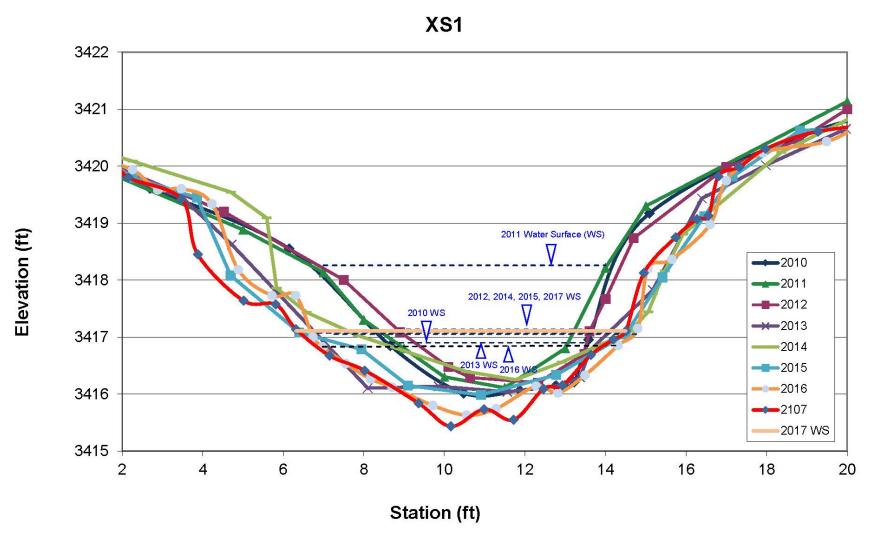

Chart 3-1. McGinnis Creek Stream Cross-Section 1.

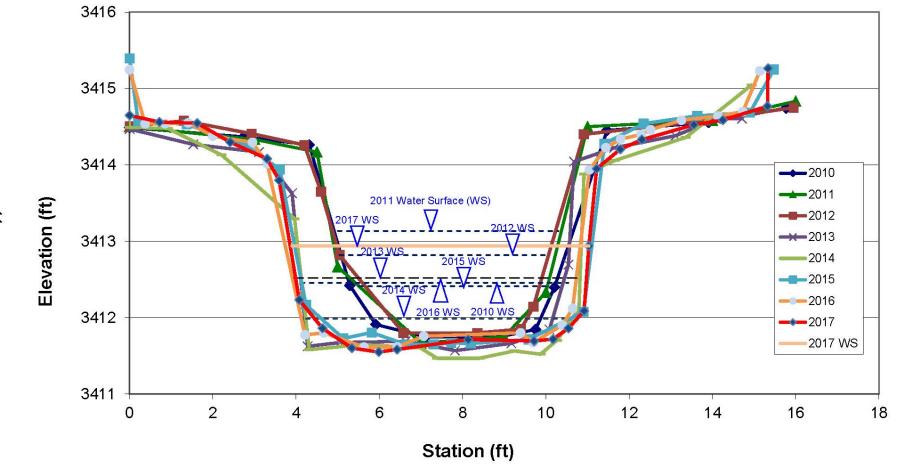

Chart 3-2. McGinnis Creek Stream Cross-Section 2.

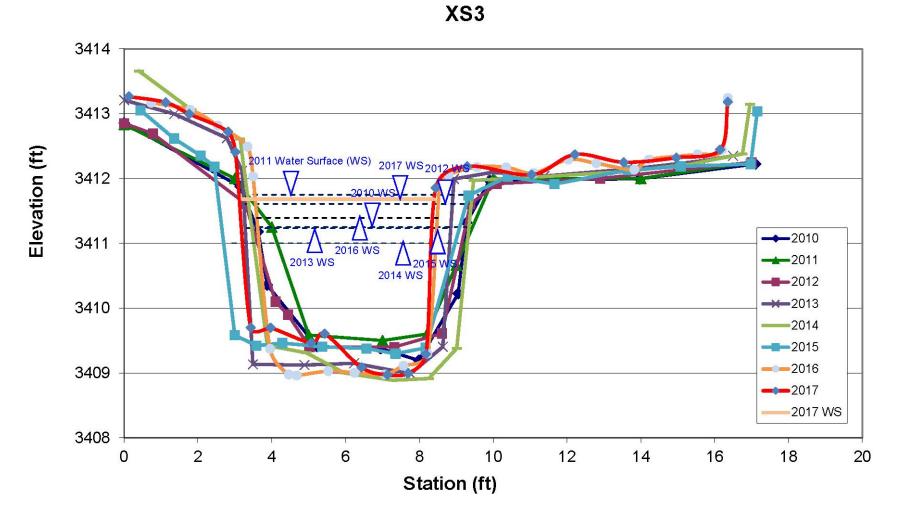

Chart 3-3. McGinnis Creek Stream Cross-Section 3.

#### 3.3 VEGETATION

Vegetation communities were mapped and named based on the dominant species within a community and the results of the wetland delineation data. A list of the 155 plant species that were identified at the McGinnis Meadows site from 2010 to 2017 is provided in Table 3-2. No new plant species were identified in 2017. The communities and associated species are listed on the Wetland Mitigation Site Monitoring form (Appendix B) and mapped on Figure A-3 (Appendix A). The 2017 monitoring event identified 11 vegetation communities including 7 wetland types and 4 upland types (Figure A-3, Appendix A). In general, vegetation communities across the majority of the site (95 percent) have remained stable with just a slight change to a portion of the upland/boundary in an area that displayed increased hydrology and sedge development. Reed canary grass appears to be gaining dominance in several vegetation communities. The McGinnis Meadows vegetation communities are discussed in this section.

Upland community Type 1 – *Alopecurus pratensis/Phalaris arundinacea* was identified within 2.27 acres in 2017. The frequency and duration of wetland hydrology in portions of the historic upland area resulted in portions of this upland community converting to a new wetland community type (18 – *Alopecurus pratensis/Carex* spp.) in 2013 and 2014. However, in 2016 and 2017, the upland community increased by 0.13 acre along the northern boundary, which most likely occurred because of drier-than-average conditions in the region. The upland community occurred along the higher elevations adjacent to wetland communities. This upland community was dominated by facultative and facultative wetland species. Field meadow foxtail (*Alopecurus pratensis*) dominated the community with lesser amounts of reed canary grass and five secondary species present at 5 percent cover or less (Wetland Mitigation Site Monitoring form, Appendix B).

Wetland community Type 2 – Aquatic Macrophytes/Open Water has developed on 1.91 acres in the deeper contours of the excavated depressions. The vegetation community has established under persistently inundated growing conditions. Vegetation species within the inundated areas included aquatic macrophytes, green algae, American mannagrass (*Glyceria grandis*), reed canary grass, Northwest Territory sedge (*Carex utriculata*), and three other species with less than 1 percent cover each.

Upland Type 4 – *Picea engelmannii/Alopecurus pratensis* represented two small upland forests that are located on 0.86 acre in the southeast corner of the property, which contained a high percent cover of Canada thistle (*Cirsium arvense*). Woody species included Englemann's spruce (*Picea engelmannii*), lodgepole pine (*Pinus contorta*), ponderosa pine (*Pinus ponderosa*), and common snowberry (*Symphoricarpos albus*). Field meadow foxtail and reed canary grass dominated the understory.

Wetland community Type 5 – *Phalaris arundinacea/Alnus incana* was a 1.64-acre, scrub/shrub, speckled alder (*Alnus incana*) and black hawthorn (*Crataegus douglasii*) community located near the southwestern property corner. Reed canary grass dominated the understory. Northwest Territory sedge, American cow-parsnip (*Heracleum maximum*), American wild mint (*Mentha arvensis*), stinging nettle (*Urtica dioica*), and Canada thistle (*Cirsium arvense*) were identified within the community. The Canada thistle appeared to have been sprayed in some locations.

Table 3-2. Comprehensive List of Plant Species Identified at the McGinnis Meadows Site From 2010 Through 2017 (Page 1 of 4)

Scientific Name	Common Name	WMVC Indicator Status <sup>(a)</sup>		
Abies lasiocarpa	Subalpine Fir	FACU

<sup>(</sup>a) 2016 NWPL [Lichvar et al., 2016].

Wetland community Type 6 – *Carex utriculata* is 1.39 acres of an irregularly shaped polygon surrounded by community Type 9 – *Phalaris arundinacea/Carex* spp in the northwestern portion of the site and in the east-central area of the site. Northwest Territory sedge was the predominant species. Reed canary grass slightly decreased since the 2015 survey. Nebraska sedge (*Carex nebrascensis*) and American wild mint were also present within this community at less than 1 percent cover.

Wetland community Type 9 – *Phalaris arundinacea/Carex* spp. dominated 15.90 acres within preexisting wetlands throughout the site. Reed canary grass and *Carex* spp. dominated the community

with less than 5 percent cover of other species. This community type replaces wetland community Type 7 – *Phalaris arundinacea/Alopocurus pratensis* across the site because of the increase in sedge and decrease in reed canary grass and field meadow foxtail.

Wetland Type 11 – *Alnus incana/Carex utriculata* was identified on the 0.51-acre former McGinnis Creek channel that traverses the property north to south. Speckled alder, reed canary grass, Northwest Territory sedge, red-tinge bulrush (*Scirpus microcarpus*), and field meadow foxtail dominated the vegetation. The name of the community has been updated to reflect the increase of Northwest Territory sedge and the decrease of reed canary grass.

Upland community Type 14 – *Alopecurus pratensis/Pseudotsuga menziesii* was located within 2.16 acres in the southwest corner of the project site. Douglas fir (*Pseudotsuga menziesii*), lodgepole pine, and western larch (*Larix occidentalis*) dominated the overstory. Woody species that were present within the understory included common snowberry, speckled alder, and subalpine fir (*Abies lasiocarpa*). Field meadow foxtail dominated the herbaceous understory, and seven other species were present at less than 5 percent cover.

Upland community Type 16 – *Phalaris arundinacea*/Soil Mounds was identified on 0.28 acre that included the mounds that were created to provide woody species habitat throughout the site. The community contained reed canary grass, Canada thistle, and great mullein (*Verbascum thapsus*). None of the woody species planted in these areas survived, which was the result of herbivory by native ungulates.

Wetland community Type 18 – *Alopecurus pratensis/Carex* spp. was identified for the first time in 2013 to characterize a 0.16-acre area located near the southeastern border of the project. The extent of the community increased by 1.17 acres to 1.33 acres in 2014 and remained unchanged in 2017. A wetland plant community has developed in an area that was previously delineated as upland. The community is dominated by field meadow foxtail, Bebb's sedge (*Carex bebbii*), slender-beak sedge (*Carex athrostachya*), tufted hair grass (*Deschampsia caespitosa*), and Colorado rush (*Juncus confusus*).

Wetland community Type 19 – *Carex* spp. characterized 3.75 acres of the excavated depressions that exhibited a slightly drier moisture regime (saturated, not inundated) than the adjacent open water of community Type 2 – Aquatic Macrophytes/Open Water. The community was renamed in 2012 from community Type 13 – *Deschampsia caespitosa/Glyceria grandis* and again in 2015 from community Type 17 – *Glyceria grandis/Carex* spp. to reflect an increase in the prevalence of sedge species and a decrease in the amount of tufted hair grass and American manna grass. Nebraska sedge, Bebb's sedge (*Carex bebbii*), slender-beak sedge (*Carex arthrostachya*), lesser bladder sedge (*Carex vesicaria*), knotted rush (*Juncus nodosus*), Northwest Territory sedge, speckled alder, Canada thistle, and reed canary grass dominated the diverse community.

Polygon 15 in Figure A-3 (Appendix A) represents 0.75 acre of open water that was identified as waters of the US within the ordinary high water mark (OHWM) of the McGinnis Creek channel.

Table 3-3 and Charts 3-4 and 3-5 summarize the data collected in 2017 for T-1. This transect intersects two excavated wetland basins and four communities, including upland Type 4 – *Picea engelmannii/ Alopecurus pratensis*, wetland Type 2 – Aquatic Macrophytes/Open Water, wetland Type 9 – *Phalaris arundinacea/Carex* spp., and wetland Type 19 – *Carex* spp. The percent cover of sedge species along the transect has increased annually and replaced dominant communities of tufted hair grass and American mannagrass. Open water along the transect has decreased since 2014. Hydrophytic species dominated 94 percent of the transect in 2017. The cover of wetland plants in the constructed depressions continued to increase from 2012 to 2017.

Table 3-3. Data Summary for T-1 From 2010 Through 2017 at the McGinnis Mitigation Site

Monitoring Year		2011	2012	2013	2014	2015	2016	2017
Transect Length (feet)		504	504	504	504	504	504	504

**Chart 3-5.** Length of Habitat Types Within T-1 From 2010 Through 2017.

T-2 extends north 1,000 feet from the center of the property to the site boundary. Data from this transect are summarized in Table 3-4 and Charts 3-6 and 3-7. The transect crossed the waters of the US that are associated with the constructed McGinnis Creek channel and two wetland communities in 2017: Type 9 – *Phalaris arundinacea/Carex spp.* and Type 19 – *Carex* spp. The 7- and 10-foot intervals of open water shown on Chart 3-6 represent the McGinnis Creek crossings. Hydrophytic vegetation communities accounted for 98.3 percent of this transect from 2012 through 2017.

Table 3-4. Data Summary for T-2 From 2010 Through 2017 at the McGinnis Meadows Site

Monitoring Year	2010	2011	2012	2013	2014	2015	2016	2017

Canada thistle, ox-eye daisy (*Leucanthemum vulgare*), and houndstongue (*Cynoglossum officinale*) are Priority 2B noxious weeds and were identified at the McGinnis Meadows site. Infestation cover classes ranged from trace (<1 percent) to high (26–100 percent cover). Canada thistle has invaded upland areas that were disturbed during construction and is common around the perimeter of the site. A total of 43 infestations were noted in 2017 across the site. Two infestations of gypsy-flower were mapped in the southeastern quarter of the site. One infestation of ox-eye daisy was mapped along the northern project boundary. The infestation size cover class was less than 1 percent.

Survival of containerized woody plants across the site was low in 2010 after the initial planting effort. A majority of the plants were installed on upland islands site-wide. Intensive wildlife browse and trampling severely compromised the survival of the woody plants. Initial survival rates were estimated at less than 10 percent. Additional woody species were planted in spring 2011. A total of 150 alder (*Alnus* sp.), 15 quaking aspen (*Populus tremuloides*), and 15 planted willows (*Salix* sp.) were observed alive in 2012. Approximately 125 living alder were observed along the former channel of McGinnis Creek in 2017, which was similar to previous surveys. The survival rate of the planted alder was estimated at 40 percent. The shrubs appeared to be a combination of planted, relic, and recruited alders and were not differentiated during the field survey. The natural recruitment of quaking aspen was noted in the southeastern and northeastern corners of the site in 2016 and 2017. Approximately 250 live quaking aspen were observed in 2017. No live red-osier dogwoods, willow (*Salix* spp.), or birch (*Betula* sp.) were observed within the planting clusters. The height and density of reed canary grass site-wide obscured the smaller woody saplings and complicated the survival assessment.

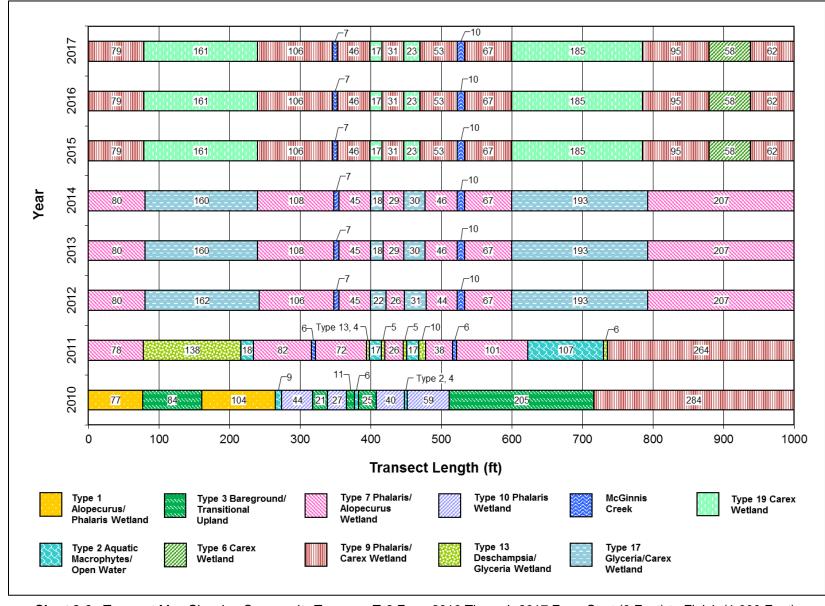

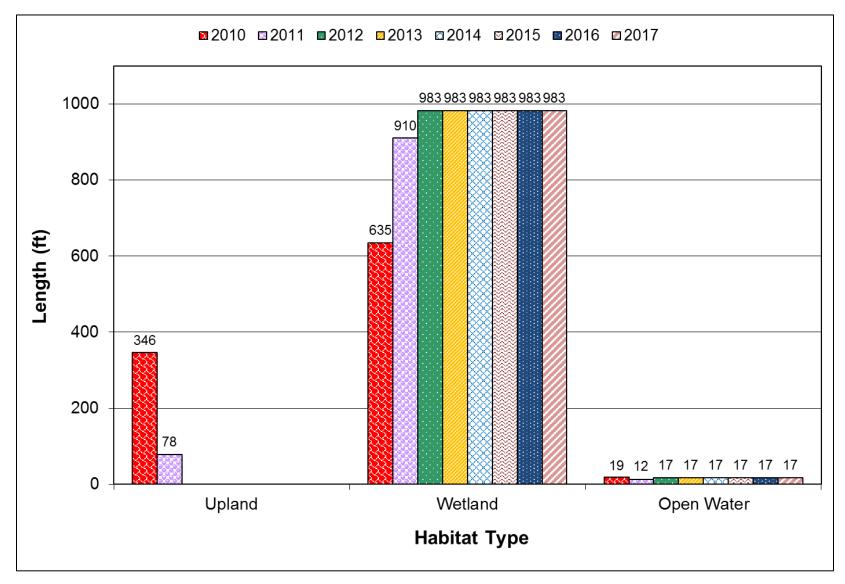

Chart 3-6. Transect Map Showing Community Types on T-2 From 2010 Through 2017 From Start (0 Foot) to Finish (1,000 Feet).

**Chart 3-7.** Length of Habitat Types Within T-2 From 2010 Through 2017.

#### **3.4 SOIL**

The Web Soil Survey for Lincoln County Area [USDA, 2016] has mapped the McGinnis Meadows site as containing Fluvent soils. Fluvent soils are commonly found on floodplains and contain mixed alluvium. These soil types are excessively drained, gravelly silt loams that are taxonomically classified as sandy, mixed, frigid Typic Udifluvents that are considered hydric.

Two test pits were profiled throughout the McGinnis Meadows site in 2017. DP-1W is located in wetland community Type 9 – *Phalaris arundinacea/Carex* spp. and met the three wetland criteria. The soil profile at DP-1W contained an upper layer that was 12 inches of dark (10YR 2/1) loam with 5 percent redoximorphic concentration (10YR 3/6). The matrix had a lower layer below 12 inches that consists of clay loam textured soil with a depleted matrix (10YR 4/2). The soil at DP-1U was a dark (10YR 3/1) loam in the upper 4 inches and 10YR 4/3 silty clay loam from 12 to 16 inches with no hydric indicators. The upland data point was taken on an upland mound just upgradient from the adjacent wetland and met the wetland criteria for hydrophytic vegetation; however, no indicators of hydric soils or wetland hydrology were observed at the data point. In general, the evaluated soils within the McGinnis Meadows project area confirmed the NRCS mapped series.

#### 3.5 WETLAND DELINEATION

Two sites within the project area were sampled in 2017 to define the vegetation, soil, and hydrology of site wetlands (Figure A-2, Appendix A). The Wetland Determination Data forms are included in Appendix B. The July 24, 2017, delineation identified a total of 26.4 acres of wetland habitat and 0.75 acre of stream habitat within the 32.75-acre project area, as shown in Table 3-5. The wetland acreage remained the same from 2016 to 2017. Wetland habitat on the site included the aquatic bed and emergent wetland community types that have established in the open-water areas of the constructed depressions from 2011 through 2017. The percent cover of vegetation within the depressions continued to increase in 2017. A limited amount of scrub/shrub habitat exists in the southwestern portion of the site as well.

MDT seeks to obtain approximately 8,835 stream credits to restore 2,850 linear feet of McGinnis Creek associated with the area below the OHWM of this channel. This area represents 0.75 acre of open water across the site (Table 3-5).

Table 3-5. Wetland Acres Delineated From 2010 Through 2017 at the McGinnis Meadows Site

Habitat Type	2010 (acres)	2011 (acres)	2012 (acres)	2013 (acres)	2014 (acres)	2015 (acres)	2016 (acres)	2017 (acres)
Unvegetated Open Water	1.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Wetlands	18.22	20.64	25.12	25.38	26.55	26.40	26.40	26.40
Total Wetland Habitat	19.22	20.64	25.12	25.38	26.55	26.40	26.40	26.40
McGinnis Creek - Open Water	0.75	0.75	0.75	0.75	0.75	0.75	0.75	0.75
Total Stream Habitat	0.75	0.75	0.75	0.75	0.75	0.75	0.75	0.75

#### 3.6 WILDLIFE

Table 3-6 is a comprehensive list of animal species observed directly or indirectly from 2010 through 2017 (Wetland Mitigation Site Monitoring form, Appendix B). Observations made by MDT staff on the same day that monitoring occurred are included in the species list for 2017. A total of 28 different bird species were identified at the site in 2017. Other wildlife or signs of wildlife (i.e., scat and tracks) that were directly observed included white-tailed deer (*Odocoileus virginianus*), elk (*Cervus canadensis*), moose (*Alces americanus*), western jumping mouse (*Zapus princeps*), and ground squirrels (*Marmotini* sp.). Several small trout were observed in McGinnis Creek, and confirmed to be brook trout (*Salvelinus fontinalis*) through rod-and-reel surveys by the monitoring crew. The wildlife seen in 2017 are bolded in Table 3-6. Five bird boxes were installed on the site in fall 2012. The bird boxes were being used by tree swallows (*Tachycineta bicolor*) in 2017.

Table 3-6. Wildlife Species Observed at the McGinnis Meadows Site From 2010 Through 2017 (Page 1 of 3)

Common Name	Scientific Name
Am	phibian
Columbia Spotted Frog	Rana luteiventris
Frog sp.	Rana sp.
Western Toad	Bufo boreas
F	Reptile
Common Gartersnake	Thamnophis sirtalis
	Bird
Alder Flycatcher	Empidonax alnorum
American Robin	Turdus migratorius
American Three-Toed Woodpecker	Picoides dorsalis
Bald Eagle	Haliaeetus leucocephalus
Bank Swallow	Riparia riparia
Black-Billed Magpie	Pica hudsonia
Brewer's Blackbird	Euphagus cyanocephalus
Bufflehead	Bucephala albeola
Calliope Hummingbird	Stellula calliope
Canada Goose	Branta canadensis
Cedar Waxwing	Bombycilla cedrorum
Chipping Sparrow	Spizella passerina
Clark's Nutcracker	Nucifraga columbiana
Common Merganser	Mergus merganser
Common Raven	Corvus corax
Common Sandpiper	Actitis hypoleucos
Common Snipe	Gallinago gallinago
Common Yellowthroat	Geothlypis trichas
Dusky Flycatcher	Empidonax oberholseri
Eastern Kingbird	Tyrannus tyrannus
Evening Grosbeak	Coccothraustes vespertinus
Gadwall	Anas strepera

Table 3-6. Wildlife Species Observed at the McGinnis Meadows Site From 2010 Through 2017 (Page 2 of 3)

Common Name	Scientific Name
	Bird
Golden Eagle	Aquila chrysaetos
Gray Catbird	Dumetella carolinensis
Great Blue Heron	Ardea herodias
Great Horned Owl	Bubo virginianus
Hairy Woodpecker	Picoides villosus
Lincoln's Sparrow	Melospiza lincolnii
Mallard	Anas platyrhynchos
Mountain Bluebird	Sialia currucoides
Mountain Chickadee	Poecile gambeli
Northern Flicker	Colaptes auratus
Northern Harrier	Circus cyaneus
Pine Siskin	Carduelis pinus
Red-Naped Sapsucker	Sphyrapicus nuchalis
Red-Tailed Hawk	Buteo jamaicensis
Red-Winged Blackbird	Agelaius phoeniceus
Savannah Sparrow	Passerculus sandwichensis
Sharp-Shinned Hawk	Accipter striatus
Song Sparrow	Melospiza melodia
Sora	Porzana carolina
Sparrow sp.	
Spotted Sandpiper	Actitis macularius
Swallow sp.	
Tree Swallow	Tachycineta bicolor
Turkey Vulture	Cathartes aura
Unknown Flycatcher	
Western Flycatcher	Empidonix trailii
Western Kingbird	Tyrannus verticalis
Western Meadowlark	Sturnella neglecta
Western Tanager	Piranga ludoviciana
Western Wood-Peewee	Contopus sodidulus
Wilson's Snipe	Gallinago delicata
Wood Duck	Aix sponsa
Yellow Warbler	Dendroica petechia
Yellow-Rumped Warbler	Dendroica coronata

Table 3-6. Wildlife Species Observed at the McGinnis Meadows Site From 2010 Through 2017 (Page 3 of 3)

Common Name	Scientific Name				
Mammal					
Coyote	Canis latrans				
Deer Sp.	Odocoileus sp.				
Elk or Wapiti	Cervus canadensis				
Gray Wolf	Canis lupus				
Meadow Vole	Microtus pennsylvanicus				
Moose	Alces americanus				
Mule Deer	Odocoileus hemionus				
American Red Squirrel	Tamiasciurus hudsonicus				
Richardson's Ground Squirrel	Spermophilus richardsonii				
Striped Skunk	Mephitis mephitis				
Western Jumping Mouse	Zapus princeps				
White-tailed Deer	Odocoileus virginianus				
	Fish				
Trout sp.					

Species that were identified in 2017 are bolded.

#### 3.7 FUNCTIONAL ASSESSMENT

Functional assessments were completed on four AAs from 2010 through 2017 using the 2008 MWAM; the results are provided in Table 3-7. The MWAM forms are included in Appendix B. The four AAs were divided into Creation (8.6 acres), Restoration (reestablishment and rehabilitation; 16.6 acres), Enhancement (existing emergent wetland; 0.9 acre), and Preservation (existing riverine wetlands; 0.30 acre) (Figure A-4, Appendix A).

The original on-site wetlands were impacted historically from grazing, leveling, channel straightening, and hydrological alterations according to the 2005 baseline site evaluation. The wetland conservation easement area has been fenced, and grazing has been excluded. The original baseline evaluation rated the historic waters of the US as Category III wetlands using the 1999 MDT Wetland Assessment Method [Berglund, 1999]. All four AAs are now rated as either Category I or II with high ratings for wildlife habitat, short- and long-term surface-water storage, sediment/nutrient/toxicant removal, production export/food chain support, and groundwater discharge/recharge.

#### 3.8 PHOTOGRAPHIC DOCUMENTATION

Photographs that were taken at Photo-Points 1 through 7 (PP1 to PP7), transect endpoints, stream cross sections, and wetland determination data points are shown in Appendix C.

Table 3-7. Functions and Values at the McGinnis Meadows Site From 2010 Through 2017 (Page 1 of 4)

Function and Value Parameters From the 2008 MDT Montana Wetland Assessment Method <sup>(a)</sup>	2010 Creation (excavated cells)	2011 Creation (excavated cells)	2012 Creation (excavated cells)	2013 Creation (excavated cells)	2014 Creation (excavated cells)	2015 Creation (excavated cells)	2016 Creation (excavated cells)	2017 Creation (excavated cells)

#### 3.9 MAINTENANCE NEEDS

Canada thistle, ox-eye daisy, and houndstongue, which are Priority 2B noxious weeds, were identified at the McGinnis Meadows site. Infestations had cover classes ranging from trace (<1 percent) to high (26–100 percent cover). Canada thistle has invaded upland areas that were disturbed during construction. Two infestations of gypsy-flower were mapped in the southeast quarter of the site. One infestation of ox-eye daisy was mapped along the northern project boundary. The infestation cover class was less than 1 percent. MDT has an ongoing weed-control program for their mitigation sites, which included spraying this site on August 3, 2017.

Five bird boxes were installed on this site in fall 2012 and were used by tree swallows in 2017. All of the bird boxes are in good functioning condition. The mitigation site design relied on excavating shallow depressions to intercept groundwater, increase hydrologic connectivity with McGinnis Creek and the adjacent floodplain, and passively increase the local water table. Consequently, water-control structures were not a part of the design. MDT spent 3 days in 2016 and 1 day in 2017 repairing damaged fence sections around the perimeter of the site and those repairs appeared to be holding in 2017. A large tree had recently fallen across the perimeter fence in the southeastern corner of the site near PP1. The fence should be examined by MDT during future site visits to determine if repair is necessary.

#### 3.10 CURRENT CREDIT SUMMARY

Goals that were established in 2009 for the McGinnis Meadows mitigation project included restoring approximately 0.8 acre of riparian/stream habitat on McGinnis Creek and 17.3 acres of degraded wetlands. Credit was to be awarded for creating 2.9 acres of emergent wetlands and enhancing 1.74 acres of existing emergent wetland and an intermittent drainage. Preserving 0.3 acre of existing riparian communities along the abandoned McGinnis Creek corridor and maintaining 2.2 acres of upland buffer provided additional wetland credits. Table 3-8 details the project credit ratios approved by the USACE and the calculated credit acreages from 2011 through 2017. Total wetland mitigation credits calculated for the McGinnis Meadows site in 2017 were 20.48 credit acres, which is 4.15 acres more than the original estimate for the site.

Table 3-9 provides a summary of the site's performance against approved success criteria. All of the wetlands that were delineated within the site in 2017 satisfied the criteria for wetland hydrology, hydrophytic vegetation, and hydric soils. The cover of wetland plants increased significantly from 60 percent in 2010 to 95 percent from 2012 through 2017. The success criterion that stipulate 70 percent cover of wetland plants was met site-wide in 2012. The cover density continued to increase into 2017. Vegetation cover within the disturbed areas of the upland buffer also exceeded 50 percent by 2012. The cover of state-listed noxious weed species in the site wetlands has remained less than 5 percent, which satisfies the performance standard. MDT continues to monitor and control noxious weeds within this mitigation site.

Table 3-9. Summary of Performance Standards and Success Criteria Compared to Existing Site Conditions (Page 1 of 2)

Performance Standards	Success Criteria	Criteria Achieved Y/N	Discussion
Wetland Characteristics	All of the restored, created, enhanced, and preserved wetlands within the project limits will meet the three parameter criteria for hydrology, vegetation, and soils as outlined in the 1987 Wetland Manual and 2010 Regional Supplement.	Y	Areas that were identified as wetland habitat within the mitigation site meet the three parameter criteria.
Wetland Hydrology	Soil saturation is present for at least 12.5 percent of the growing season.	Y	Areas that were identified as wetland habitat within the mitigation site exhibit soil saturation for a minimum 12.5 percent of growing season.
Lhudria Cail	Hydric soil conditions are present or appear to be forming.	Y	Hydric soil characteristics, including redoximorphic concentrations and depleted matrix, have developed throughout a majority of the constructed wetlands.
Hydric Soil	Soil is sufficiently stable to prevent erosion.	Υ	Disturbed soil is stable and does not exhibit signs of erosion.
	Soil is able to support plant cover.	Υ	Plant cover across the disturbed soils is near 100 percent.
Hydrophytic	Success is achieved where aerial cover of facultative or wetter species is greater than or equal to 70 percent.	Y	Areas that were identified as wetland habitat within the mitigation site support a prevalence of hydrophytic vegetation (OBL, FACW, and FAC) at greater than 70 percent cover.
Vegetation	Montana state-listed noxious weeds do not exceed 5 percent cover.	Y	Montana state-listed noxious weed cover within wetland areas of the site is estimated at 2–3 percent.
Woody Plants	Plantings will be considered successful where they exceed 50 percent survival after 5 years.	N	The percentage of living woody vegetation (including natural recruitment of <i>Alnus</i> among the former channel) is well below the 50 percent target.
Open Water	Open-water area will be considered creditable under this plan.	Υ	Open water appears to be perennial in several of the excavated cells. These areas exhibit vegetation cover generally greater than 20 percent.
McGinnis Creek Channel	Revegetation along the new McGinnis Creek channel corridor will be considered successful when banks are vegetated with a majority of deep-rooting riparian and wetland plant species.	Y	Vegetation along the constructed McGinnis Creek support robust vegetation with high root-stability indices and predominantly includes reed canary grass.

Performance Standards	Success Criteria	Criteria Achieved Y/N	Discussion
McGinnis Creek Channel	The intent of the stream restoration is to allow the stream to migrate naturally within the floodplain and to give it enough room to move and stabilize itself within the site.	Y	The stream has plenty of room to migrate within the boundary of the mitigation site.
	Noxious weeds do not exceed 5 percent cover within upland buffer area.	Υ	Noxious weed cover is less than 5 percent within the upland buffer.
Upland Buffer	Any area disturbed within creditable buffer zone must have at least 50 percent aerial cover of nonweed species by end of monitoring period.	Y	Disturbed areas are well-vegetated (approximately 100 percent) by nonweed species.
Weed Control	Success will be based on annual monitoring of the site to determine weed species and degree of infestation within the site. Control measures, based on the monitoring results, will be implemented by MDT to minimize and/or eliminate the intrusion of state-listed noxious weed species within the site.	Y	State-listed noxious weed species across the site have been mapped yearly. Maps of weed infestations have been provided to MDT for evaluation, and control measures have been employed.
Fencing	Wildlife-friendly fencing will be installed along the easement boundaries.	Υ	Wildlife-friendly fencing has been installed around the easement boundaries. A tree has fallen on the southeastern perimeter fence near PP1, and repairs are needed.

The woody plants installed in 2011 exhibited high mortality immediately after installation with approximately 20 percent survival. The majority of woody plants that initially survived have continued to develop. The success criterion for 50 percent survival of the woody vegetation has not been met. An increase in natural recruitment of quaking aspen and speckled alder was observed in 2017 in areas seasonally inundated by groundwater. Site-wide percent cover by planted and natural woody recruitment is estimated at less than 10 percent.

Photographs of the cross sections in Appendix C illustrate the high vegetation cover on the banks of the restored channel. The McGinnis Creek restoration success criterion that pertains to well-vegetated banks with a majority of deep-rooting riparian and wetland plant species has been satisfied. The new McGinnis Creek channel was built on a new alignment with minimal disturbance to the surrounding landscape. Existing streambanks are primarily vegetated with reed canary grass.

MDT Wetland Mitigation Monitoring McGinnis Meadows Lincoln County, Montana

# APPENDIX B MONITORING FORMS

MDT Wetland Mitigation Monitoring McGinnis Meadows Lincoln County, Montana

#### RESPEC/MDT WETLAND MITIGATION SITE MONITORING FORM

Project Name: McGinnis Meadows Project Number: STPX-NH 27(17)

Assessment Date: <u>July 24, 2017</u> Person(s) conducting the assessment: <u>M. Traxler, K.</u>

**Schroeder** 

Location: 7 miles south of US 2 MDT District: Missoula

Milepost: NA

Legal Description: T 26N R 28W Section 33

Weather Conditions: **sunny, mid 80s**Time of Day: **afternoon** 

Initial Evaluation Date: <u>July 16, 2010</u> Monitoring Year: <u>8</u> # Visits in Year: <u>1</u>
Size of evaluation area: <u>32.75 acres</u> Land use surrounding wetland: <u>Hay production and</u>
grazing, rural residential, USFS property (forest), Plum Creek properties (commercial forest).

#### **HYDROLOGY**

Surface Water Source: McGinnis Creek, precipitation, shallow groundwater.

Inundation: **Present** Average Depth: **0.5 feet** Range of Depths: **0-2 feet** 

Percent of assessment area under inundation: 15%

Depth at emergent vegetation-open water boundary: 1.0 feet

If assessment area is not inundated then are the soils saturated within 12 inches of surface: <u>Yes</u> Other evidence of hydrology on the site (ex. – drift lines, erosion, stained vegetation, etc.):

#### FAC-neutral test, geomorphic position, drainage patterns, hydrogen sulfide odor

Groundwater Monitoring Wells: **Present** 

Record depth of water below ground surface (in feet):

Well Number	Depth	Well Number	Depth	Well Number	Depth
MW-1	4.46				
MW-2	3.39				
MW-3	5.25				

A 1 1'.' 1	A	O1 11'
Additional	Activities	( hecklist.
лишили	ACHVILLOS	CHECKIISI.

	Maj	o emergent	vegetation	-open water	boundar	y on aerial	photograph.
--	-----	------------	------------	-------------	---------	-------------	-------------

Observe extent of surface water during each site visit and look for evidence of past surface water elevations (drift lines, erosion, vegetation staining, etc.)

Use GPS to survey groundwater monitoring well locations, if present.

#### **COMMENTS / PROBLEMS:**

Wells monitored by USGS.

#### MDT WETLAND MONITORING - VEGETATION TRANSECT

Cover EstimateIndicator ClassSource+ = < 1%3 = 11-10%+ = ObligateP = Planted1 = 1-5%4 = 21-50%- = Facultative/WetV = Volunteer

2 = 6-10% 5 = > 50% 0 = Facultative

Percent of perimeter developing wetland vegetation (excluding dam/berm structures): 100%

Establish transects perpendicular to the shoreline (or saturated perimeter). The transect should begin in the upland area. Permanently mark this location with a standard metal fencepost. Extend the imaginary transect line towards the center of the wetland, ending at the 3 foot depth (in open water), or at the point where water depths or saturation are maximized. Mark this location with another metal fencepost.

Estimate cover within a 10 foot wide "belt" along the transect length. At a minimum, establish a transect at the windward and leeward sides of the wetland. Remember that the purpose of this sampling is to monitor, not inventory, representative portions of the wetland site.

Comments: \_\_\_\_

#### **PHOTOGRAPHS**

Take photographs of the following permanent reference points listed in the check list below. Record the direction of the photograph using a compass. When at the site for the first time, establish a permanent reference point by setting a ½ inch rebar or fencepost extending 2-3 feet above ground. Survey the location with a resource grade GPS and mark the location on the aerial photograph.

Ph	notograph Checklist:
	One photograph for each of the four cardinal directions surrounding the wetland.
	At least one photograph showing upland use surrounding the wetland. If more than one upland
	exists then take additional photographs.
	At least one photograph showing the buffer surrounding the wetland.
	One photograph from each end of the vegetation transect, showing the transect.

	Watershed: 1 - Kootenai C	ounty: Lincoln						
	7. Evaluating Agency: RESPEC for MDT Purpose of Evaluation: Wetland potentially affected by MDT project Mitigation wetlands; pre-construction Mitigation wetlands; post-construction Other (visually estimated)  8. Wetland Size (acre): (visually estimated)							
10			ATS IN AA (See manual for def	r	0/ 05 44			
L	HGM Class (Brinson)	Class (Cowardin)	Modifier (Cowardin)	Water Regime	% OF AA			
	Depressional	Aquatic Bed	Excavated	Permanent / Perennial	60			
	Depressional	Emergent Wetland	Excavated	Seasonal / Intermittent	40			
ľ								

11. ESTIMATED RELATIVE ABUNDANCE (of similarly classified sites within the same Major Montana Watershed Basin; see manual.) <a href="mailto:common">common</a>

12. GENERAL CONDITION OF AA

i. Disturbance: Use matrix below to select the appropriate response; see manual for Montana listed noxious weed and aquatic nuisance vegetation species lists.

	Predominant Conditions Adjacent to (within 500 feet of) AA									
Conditions within AA	Managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or buildings; and noxious weed or ANVS cover is ≤15%.	Land not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to minor clearing; contains few roads or buildings; noxious weed or ANVS cover is ≤30%.	Land cultivated or heavily grazed or logged; subject to substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.							
AA occurs and is managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or occupied buildings; and noxious weed or ANVS cover is ≤15%.		low disturbance								
AA not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to relatively minor clearing, fill placement, or hydrological alteration; contains few roads or buildings; noxious weed or ANVS cover is ≤30%.										
AA cultivated or heavily grazed or logged; subject to relatively substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.										

Comments (types of disturbance, intensity, season, etc.): AA contains several depression areas that were excavated within uplands in 2009. Many of these depressions were ponded in 2017 with 0.2 to 1 foot of standing water. The edges were vegetated with emergent plants.

- ii. Prominent noxious, aquatic nuisance, and other exotic vegetation species: Cirsium arvense
- iii. Provide brief descriptive summary of AA and surrounding land use/habitat: Surrounding land use is low density residential, moderate road density. Forest Service land and Plum Creek properties (commercial forest).

13. STRUCTURAL DIVERSITY (Based on number of "Cowardin" vegetated classes present [do not include unvegetated classes]; see #10 above.)

Existing # of "Cowardin" Vegetated Classes in AA	Initial Rating	Is current management peristence of additional v		Modified Rating

### 12. GENERAL CONDITION OF AA

i. Disturbance: Use matrix below to select the appropriate response; see manual for Montana listed noxious weed and aquatic nuisance vegetation species lists.

	Predominar	nt Conditions Adjacent to (within	500 feet of) AA
Conditions within AA	Managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or buildings; and noxious weed or ANVS cover is ≤15%.	Land not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to minor clearing; contains few roads or buildings; noxious weed or ANVS cover is ≤30%.	Land cultivated or heavily grazed or logged; subject to substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.
AA occurs and is managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or occupied buildings; and noxious weed or ANVS cover is ≤15%.		low disturbance	
AA not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to relatively minor clearing, fill placement, or hydrological alteration; contains few roads or buildings; noxious weed or ANVS cover is ≤30%.			
AA cultivated or heavily grazed or logged; subject to relatively substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.			

Comments (types of disturbance, intensity, season, etc.): Area includes existing emergent wetland along intermittent drainage.

ii. Prominent noxious, aquatic nuisance, and other exotic vegetation species: Cirsium arvense

Brainet Name: McCippia Mandaug 2 MDT Brainet #: NH 27(17) 2 Control #: 4142

iii. Provide brief descriptive summary of AA and surrounding land use/habitat: Area includes existing emergent wetland. Surrounding land use is residential moderate road density. USFS and Plum Creek properties (commercial forest).

13. STRUCTURAL DIVERSITY (Based on number of "Cowardin" vegetated classes present [do not include unvegetated classes]; see #10 above.)

Existing # of "Cowardin" Vegetated Classes in AA	Initial Rating	Is current management peristence of additional		Modified Rating

Comments: AA borders natural forested areas under management by both the USFS and Plum Creek Timber company. Numerous white-tailed deer observed onsite in 2017.

14D. GENERAL FISH HABITAT	NA (proceed to 14E
---------------------------	--------------------

If the AA is not used by fish, fish use is not restorable due to habitat constraints, or is not desired from a management perspective [such as fish entrapped in a canal], then check the NA box and proceed to 14E.

Assess this function if the AA is used by fish or the existing situation is "correctable" such that the AA could be used by fish [i.e., fish use is precluded by perched culvert or other barrier].

Type of Fishery: Cold Water (CW) Warm Water (WW) Use the CW or WW guidelines in the manual to complete the matrix.

i. Habitat Quality and Known / Suspected Fish Species in AA: Use matrix to select the functional point and rating.

Duration of Surface Water in AA	□ P	☐ Permanent / Perennial							☐ Seasonal / Intermittent						☐ Temporary / Ephemeral				
Aquatic Hiding / Resting / Escape Cover	Opti	] imal	Adeq	] uate	Po	or	Opti	] imal	Ade	] quate	Po	] or	Opt	 timal	Aded	]  uate	Po	oor	
Thermal Cover: optimal / suboptimal	0	S	0	s	0	s	0	s	0	S	0	s	0	S	0	S	0	s	
FWP Tier I fish species																			
FWP Tier II or Native Game fish species																			
FWP Tier III or Introduced Game fish																			
FWP Non-Game Tier IV or No fish species																			

Sources used for identifying fish spp. potentially found in AA:

ii. Modified Rating: NOTE: Modified score cannot exceed 1.0 or be less than 0.1.

a) Is fish use of the AA significantly reduced by a culvert, dike, or other man-made structure or activity, or is the waterbody included on the current final MDEQ list of waterbodies in need of TMDL development with listed "Probable Impaired Uses" including cold or warm water fishery or aquatic life support, or do aquatic nuisance plant or animal species (see Appendix E) occur in fish habitat? TES, reduce score in i by 0.1 = or NO

b) Does the AA contain a documented spawning area or other critical habitat feature (i.e., sanctuary pool, upwelling area; specify in comments) for native fish or introduced game fish?  $\square$  YES, add to score in i or iia 0.1 = or  $\square$  NO

iii. Final Score and Rating: Comments: Not connected to any fish habitat

### 14E. FLOOD ATTENUATION

■ NA (proceed to 14F) Applies only to wetlands that are subject to flooding via in-channel or overbank flow.

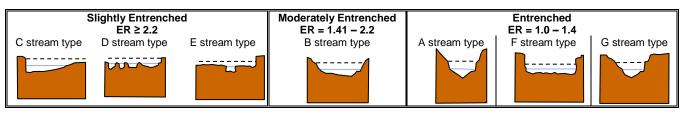

If wetlands in AA are not flooded from in-channel or overbank flow, check the NA box and proceed to 14F.

Entrenchment Ratio (ER) Estimation (see manual for additional guidance). Entrenchment ratio = (flood-prone width) / (bankfull width). Flood-prone width = estimated horizontal projection of where 2 X maximum bankfull depth elevation intersects the floodplain on each side of the stream.

18 / 6

flood prone width / bankfull width = entrenchment ratio

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating.

Estimated or Calculated Entrenchment	⊠ SI	ightly Entre	nched	☐ Mod	erately Enti	renched	☐ Entrenched			
(Rosgen 1994, 1996)	C, D	, E stream t	ypes	Е	stream typ	e	A, F, G stream types			
Percent of Flooded Wetland Classified as			$\boxtimes$							
Forested and/or Scrub/Shrub	75%	25-75%	<25%	75%	25-75%	<25%	75%	25-75%	<25%	
AA contains no outlet or restricted outlet			.6M							
AA contains unrestricted outlet										

ii. Are ≥10 acres of wetland in the AA subject to flooding AND are man-made features which may be significantly damaged by floods located within 0.5 mile downstream of the AA? YES NO Comments: AA subject to periodic flooding from McGinnis Creek

14F.	. SHORT AND LONG TERM SURFACE WATER STORAGE	☐ NA (proceed to 14G)
	Applies to wetlands that flood or pond from overbank or in-chann	el flow, precipitation, upland surface flow, or groundwater flow.
	If no wetlands in the AA are subject to flooding or ponding, then of	check the NA box and proceed to 14G.

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating. Abbreviations for surface water durations are as follows: P/P = permanent/perennial; S/I = seasonal/intermittent; and T/E = temporary/ephemeral [see manual for further definitions of these terms].

Estimated Maximum Acre Feet of Water Contained in Wetlands within the AA that are Subject to Periodic Flooding or Ponding	☐ >5 acre feet			<b>□ 1</b> .1	to 5 ac	re feet	⊠ ≤1 acre foot		
Duration of Surface Water at Wetlands within the AA	□ <b>P/P</b>	□ S/I	□ <b>T/E</b>	□ <b>P/P</b>	□ S/I	□ <b>T/E</b>	□ <b>P/P</b>	□ S/I	⊠ T/E
Wetlands in AA flood or pond ≥ 5 out of 10 years									
Wetlands in AA flood or pond < 5 out of 10 years									.1L

Comments: AA is too small to provide much flood storage

14G.	<b>SEDIMENT</b>	/ NUTRIENT /	TOXICANT	RETENTION	AND REMOVAL	□ NA (	(proceed to 1	4H
------	-----------------	--------------	----------	-----------	-------------	--------	---------------	----

Applies to wetland with potential to receive sediments, nutrients, or toxicants through influx of surface or ground water or direct input. If no wetlands in the AA are subject to such input, check the NA box and proceed to 14H.

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating.

Sediment, Nutrient, and Toxicant Input Levels within AA	AA receive has potent nutrients, such that of substantial sedimental toxicants, present.	tial to delive or compou other funct ally impaire tion, source	er sedime inds at lev ions are n d. Minor es of nutr	nts, els ot ients or	need of TMDL causes" relations toxicants or A has potential nutrients, or of functions are sedimentation	Vaterbody is on MDEQ list of waterbodies in eed of TMDL development for "probable auses" related to sediment, nutrients, or oxicants or AA receives or surrounding land use as potential to deliver high levels of sediments, utrients, or compounds such that other unctions are substantially impaired. Major edimentation, sources of nutrients or toxicants, r signs of eutrophication present.				
% Cover of Wetland Vegetation in AA	⊠≥`	70%	□<	70%	□ ≥ 70% □ < 70%		70%			
Evidence of Flooding / Ponding in AA	☐ Yes	⊠ No	☐ Yes	☐ No	☐ Yes	☐ No	☐ Yes	□No		
AA contains no or restricted outlet		.8H								
AA contains unrestricted outlet										

Comments: Well vegetated with sedges, no outlet

### 14H. SEDIMENT / SHORELINE STABILIZATION NA (proceed to 14I)

Applies only if AA occurs on or within the banks of a river, stream, or other natural or man-made drainage, or on the shoreline of a standing water body which is subject to wave action.

If 14H does not apply, check the NA box and proceed to 14I.

% Cover of Wetland Streambank or Shoreline by Species with Stability	Duration of Surface Water Adjacent to Rooted Vegetation					
Ratings of ≥6 (see Appendix F).	☐ Permanent / Perennial	☐ Permanent / Perennial ☐ Seasonal / Intermittent				
□ ≥ 65%						
□ 35-64%						
☐ < 35%						

Comments: No wave action due to small size of AA

### 14I. PRODUCTION EXPORT / FOOD CHAIN SUPPORT

### 12. GENERAL CONDITION OF AA

i. Disturbance: Use matrix below to select the appropriate response; see manual for Montana listed noxious weed and aquatic nuisance vegetation species lists.

	Predominar	nt Conditions Adjacent to (within	500 feet of) AA
Conditions within AA	Managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or buildings; and noxious weed or ANVS cover is ≤15%.	Land not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to minor clearing; contains few roads or buildings; noxious weed or ANVS cover is ≤30%.	Land cultivated or heavily grazed or logged; subject to substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.
AA occurs and is managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or occupied buildings; and noxious weed or ANVS cover is ≤15%.		low disturbance	
AA not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to relatively minor clearing, fill placement, or hydrological alteration; contains few roads or buildings; noxious weed or ANVS cover is ≤30%.			
AA cultivated or heavily grazed or logged; subject to relatively substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.			

Comments (types of disturbance, intensity, season, etc.): No disturbance within AA

- ii. Prominent noxious, aquatic nuisance, and other exotic vegetation species: Cirsium arvense
- iii. Provide brief descriptive summary of AA and surrounding land use/habitat: Area includes former channel of McGinnis Creek that was abandoned when McGinnis Creek was restored. Former channel runs north-south through the property. Surrounding habitat includes undisturbed upland and other assessment areas.

13. STRUCTURAL DIVERSITY (Based on number of "Cowardin" vegetated classes present [do not include unvegetated classes]; see #10 above.)

Existing # of "Cowardin" Vegetated Classes in AA	owardin" Vegetated Classes in AA Rating existence of additional vegetated classes

AA contains no outlet or restricted outlet		.9H								
AA contains unrestricted outlet										

ii. Are ≥10 acres of wetland in the AA subject to flooding AND are man-made features which may be significantly damaged by floods located within 0.5 mile downstream of the AA? ☐ YES ☐ NO Comments: AA subject to periodic flooding from McGinnis Creek

Wetland/Site #(s): Preservation

14F.	F. SHORT AND LONG TERM SURFACE WATER STORAGE	NA (proceed to 14G)
	Applies to wetlands that flood or pond from overbank or in-channel flo	ow, precipitation, upland surface flow, or groundwater flow.
	If no wetlands in the AA are subject to flooding or ponding, then chec	k the NA box and proceed to 14G.

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating. Abbreviations for surface water durations are as follows: P/P = permanent/perennial; S/I = seasonal/intermittent; and T/E = temporary/ephemeral [see manual for further definitions of these terms].

Estimated Maximum Acre Feet of Water Contained in Wetlands within the AA that are Subject to Periodic Flooding or Ponding		>5 acre f	eet	⊠ 1.1	to 5 ac	re feet	☐ ≤1 acre foot			
Duration of Surface Water at Wetlands within the AA	□ P/P	□ S/I	□ T/E	⊠ P/P	□ S/I	□ <b>T/E</b>	□ P/P	□ S/I	□ <b>T/E</b>	
Wetlands in AA flood or pond ≥ 5 out of 10 years				.8H						
Wetlands in AA flood or pond < 5 out of 10 years										

Comments: AA includes former channel of McGinnis Creek with potential to store several feet of surface water.

#### 

Applies to wetland with potential to receive sediments, nutrients, or toxicants through influx of surface or ground water or direct input. If no wetlands in the AA are subject to such input, check the NA box and proceed to 14H.

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating.

Sediment, Nutrient, and Toxicant Input Levels within AA	AA receive has potent nutrients, such that a substantia sedimenta toxicants, present.	tial to deliv or compou other funct ally impaire tion, sourc	er sedime inds at lev ions are n d. - 11. ESTIMATED RELATIVE ABUNDANCE (of similarly classified sites within the same Major Montana Watershed Basin; see manual.) common
- 12. GENERAL CONDITION OF AA

i. Disturbance: Use matrix below to select the appropriate response; see manual for Montana listed noxious weed and aquatic nuisance vegetation

	Predominar	nt Conditions Adjacent to (within	500 feet of) AA
Conditions within AA	Managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or buildings; and noxious weed or ANVS cover is ≤15%.	Land not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to minor clearing; contains few roads or buildings; noxious weed or ANVS cover is ≤30%.	Land cultivated or heavily grazed or logged; subject to substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.
AA occurs and is managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or occupied buildings; and noxious weed or ANVS cover is ≤15%.		low disturbance	
AA not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to relatively minor clearing, fill placement, or hydrological alteration; contains few roads or buildings; noxious weed or ANVS cover is ≤30%.			
AA cultivated or heavily grazed or logged; subject to relatively substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.			

Comments (types of disturbance, intensity, season, etc.): No disturbance within AA

- ii. Prominent noxious, aquatic nuisance, and other exotic vegetation species: Cirsium arvense
- iii. Provide brief descriptive summary of AA and surrounding land use/habitat: AA includes previously delineated wetlands within conservation easement boundary. Adjacent land use includes low density residential, roads, USFS land, and Plum Creek Timber property.

13. STRUCTURAL DIVERSITY (Based on number of "Cowardin" vegetated classes present [do not include unvegetated classes]; see #10 above.)

Existing # of "Cowardin" Vegetated Classes in AA	Initial Rating	Is current management peristence of additional v		Modified Rating
≥3 (or 2 if one is forested) classes		NA	NA	NA
2 (or 1 if forested) classes	mod	NA	NA	NA
1 class, but not a monoculture		←NO	YES→	
1 class, monoculture (1 species comprises ≥90% of total cover)		NA	NA	NA

Comments: emergent and scrub-shrub

Wetland/Site #(s): Restoration

14D. GENERAL FISH HABITAT	■ NA (proceed to 14E
---------------------------	----------------------

If the AA is not used by fish, fish use is not restorable due to habitat constraints, or is not desired from a management perspective [such as fish entrapped in a canal], then check the NA box and proceed to 14E.

Assess this function if the AA is used by fish or the existing situation is "correctable" such that the AA could be used by fish [i.e., fish use is precluded by perched culvert or other barrier].

Type of Fishery: Cold Water (CW) Warm Water (WW) Use the CW or WW guidelines in the manual to complete the matrix.

i. Habitat Quality and Known / Suspected Fish Species in AA: Use matrix to select the functional point and rating.

Duration of Surface Water in AA	⊠ Po	erman	ent / P	erenn	ial		□s	easoı	nal / Ir	ntermit	tent		П П	empo	rary / I	Ephen	eral	
Aquatic Hiding / Resting / Escape Cover	Opti	] imal	Adeq		Po	or	Opti	] imal	Ade	_ quate	Po	or	Op:	_ timal	Aded	]  uate	Po	oor
Thermal Cover: optimal / suboptimal	0	s	0	s	0	s	0	s	0	S	0	S	0	S	0	S	0	S
FWP Tier I fish species			.8H													-		
FWP Tier II or Native Game fish species											-							
FWP Tier III or Introduced Game fish																		
FWP Non-Game Tier IV or No fish species																		

Sources used for identifying fish spp. potentially found in AA: MFWP

ii	Modified Pating:	NOTE: Modified score	cannot exceed 1	0 or be	lace than	Λ1
11.	wodinea Katina.	INOTE: Modified Score	cannot exceed 1	.u or be	iess man	O. I

a) Is fish use of the AA significantly reduced by a culvert, dike, or other man-made structure or activity, or is the waterbody included on the current final MDEQ list of waterbodies in need of TMDL development with listed "Probable Impaired Uses" including cold or warm water fishery or aquatic life support, or do aquatic nuisance plant or animal species (see Appendix E) occur in fish habitat? XYES, reduce score in i by 0.1 = 0.70 or \( \square\$ N0

b) Does the AA contain a documented spawning area or other critical habitat feature (i.e., sanctuary pool, upwelling area; specify in comments) for native fish or introduced game fish?  $\square$  YES, add to score in i or iia 0.1 = or  $\square$  NO

iii. Final Score and Rating: .7M Comments: Perched culvert at Bayhorse Pass Road on northern boundary of the site prevents fish passage at certain times of year.

### 14F FLOOD ATTENUATION

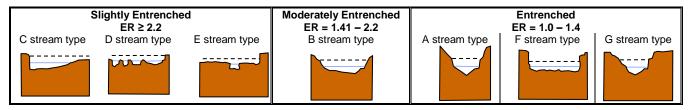

■ NA (proceed to 14F) Applies only to wetlands that are subject to flooding via in-channel or overbank flow.

If wetlands in AA are not flooded from in-channel or overbank flow, check the NA box and proceed to 14F.

Entrenchment Ratio (ER) Estimation (see manual for additional guidance). Entrenchment ratio = (flood-prone width) / (bankfull width). Flood-prone width = estimated horizontal projection of where 2 X maximum bankfull depth elevation intersects the floodplain on each side of the stream.

flood prone width / bankfull width = entrenchment ratio

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating.

Estimated or Calculated Entrenchment				☐ Mod	erately Enti	renched	☐ Entrenched			
(Rosgen 1994, 1996)	C, D, E stream types			В	stream typ	e	A, F, G stream types			
Percent of Flooded Wetland Classified as			$\boxtimes$							
Forested and/or Scrub/Shrub	75%	25-75%	<25%	75%	25-75%	<25%	75%	25-75%	<25%	
AA contains no outlet or restricted outlet										
AA contains unrestricted outlet			.5M							

ii. Are ≥10 acres of wetland in the AA subject to flooding AND are man-made features which may be significantly damaged by floods located within 0.5 mile downstream of the AA? XYES NO Comments: Residence located north of AA, elevated above floodplain and not subject to flooding. Road and culvert located directly downstream.

		Wetla	ind/Site #	(s): <u>Rest</u>	<u>oration</u>					
4F. SHORT AND LONG TERM SURFACE WATER STORAGE NA (proceed to 14G)  Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.  If no wetlands in the AA are subject to flooding or ponding, then check the NA box and proceed to 14G.										
<b>Rating:</b> Working from top to bottom, use the matrix below to select the functional point and rating. Abbreviations for surface water durations are as follows: P/P = permanent/perennial; S/I = seasonal/intermittent; and T/E = temporary/ephemeral [see manual for further definitions of these terms].										
Estimated Maximum Acre Feet of Water Contained in Wetlands within the AA that are Subject to Periodic Flooding or Ponding	Estimated Maximum Acre Feet of Water Contained in Wetlands within the AA that are Subject to									
Duration of Surface Water at Wetlands within the AA	⊠ P/P	□ S/I	□ <b>T/E</b>	□ P/P	□ S/I	□ <b>T/E</b>	□ P/P	□ S/I	□ <b>T/E</b>	
Wetlands in AA flood or pond ≥ 5 out of 10 years	1H									
Wetlands in AA flood or pond < 5 out of 10 years										
omments: Greater than 5 acre feet capacity across 18.09 acre wetland.										

Applies to wetland with potential to receive sediments, nutrients, or toxicants through influx of surface or ground water or direct input.

□ **NA** (proceed to 14H)

If no wetlands in the AA are subject to such input, check the NA box and proceed to 14H.

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating.

14G. SEDIMENT / NUTRIENT / TOXICANT / RETENTION AND REMOVAL

Sediment, Nutrient, and Toxicant Input Levels within AA	AA receive has potent nutrients, such that a substantia sedimenta toxicants, present.	tial to deliv or compou other funct illy impaire tion, sourc	er sedime inds at lev ions are n d. Minor es of nutr	ents, els ot ients or	Waterbody is need of TMDI causes" relat toxicants or A has potential nutrients, or of functions are sedimentation or signs of europe of the terms of the terms are sedimentation or signs of europe of the terms are sedimentation or signs of europe of the terms are sedimentation or signs of europe of the terms are sedimentation or signs of europe of the terms are sedimentation or signs of europe of the terms are sedimentation or signs of europe of the terms are sedimentation or signs of the terms are sedimentation.	developmer ed to sedime AA receives of to deliver hig compounds s substantially n, sources of	nt for "probak nt, nutrients, or surroundin gh levels of so such that other impaired. M nutrients or	ole or g land use ediments, er ajor
% Cover of Wetland Vegetation in AA	⊠≥°	70%	□<	70%	□≥7	70%	□<	70%
Evidence of Flooding / Ponding in AA	⊠ Yes	☐ No	☐ Yes	☐ No	☐ Yes	□No	☐ Yes	☐ No
AA contains no or restricted outlet								
AA contains unrestricted outlet	.9H							

Comments: Area receives surface runoff during precipitation events.

### 14H. SEDIMENT / SHORELINE STABILIZATION \( \square\) NA (proceed to 14I)

Applies only if AA occurs on or within the banks of a river, stream, or other natural or man-made drainage, or on the shoreline of a standing water body which is subject to wave action.

If 14H does not apply, check the NA box and proceed to 14I.

% Cover of Wetland Streambank or Shoreline by Species with Stability	Duration of S	urface Water Adjacent to Roo	ted Vegetation							
Ratings of ≥6 (see Appendix F).	Permanent / Perennial	☐ Seasonal / Intermittent	☐ Temporary / Ephemeral							
⊠ ≥ 65%	1H									
□ 35-64%										

Comments: Open water areas are subject to wave action, streambank is subject to erosion. The streambank is well vegetated (reed canarygrass, meadow foxtail) and open water areas have >65% vetetation cover.

### 14I. PRODUCTION EXPORT / FOOD CHAIN SUPPORT

i. Level of Biological Activity: Synthesis of wildlife and fish habitat rates (select).

General Fish Habitat Rating	General Wildlife Habitat Rating (14Ciii)							
(14Diii)	⊠ E/H	■ M	L					
⊠ E/H	Н							
■ M								
L								
□ NA								

**ii. Rating:** Working from top to bottom, use the matrix below to select the functional point and rating. Factor A = acreage of vegetated wetland component in the AA; Factor B = level of biological activity rating from above (14li); Factor C = whether or not the AA contains a surface or subsurface outlet; the final three rows pertain to the duration of surface water in the AA, where P/P, S/I, and T/E were previously defined, and A = "absent" [see manual for further definitions of these terms].
