1.0 INTRODUCTION

The 2018 Schrieber Meadows Wetland Mitigation Monitoring Report presents the results of the eighth year of post-construction monitoring at the Schrieber Meadows site for three pilot cells that were constructed in 2007. This report also presents the seventh year of post-construction monitoring for the remaining cells and new stream channels that were constructed during the fall of 2011. Monitoring was not completed in 2011 because of the construction of the expanded mitigation area. The Montana Department of Transportation (MDT) Schrieber Meadows mitigation project is located adjacent to the US Highway 2 corridor in Sections 11, 12, and 13, of Township 27 North, Range 30 West, Lincoln County, as shown in Figure 1-1. The 57-acre mitigation site lies within the boundaries of Watershed #1 - Kootenai River Basin. The majority of the mitigation site is situated on a 147-acre, MDT-owned parcel of land that consisted of hay fields, pastures, and clear-cut forest slopes. The remainder of the mitigation site is a 16-acre easement area in the Kootenai National Forest, adjacent to the MDT parcel. The property is bisected by Coyote Creek, which drains into Schrieber Lake and the Fisher River. Schrieber Meadows is situated within a narrow valley corridor bordered on the western and northern sides by the Kootenai National Forest. The US Highway 2 corridor bounds the area to the east. The southern boundary of this site is bordered by a second MDT-owned property (the Schrieber Lake parcel) and land owned by the Weyerhaeuser corporation.

Figures A-2 and A-3 (Appendix A) of this report show the site monitoring activity locations and mapped site features, respectively, and Figure A-4 (Appendix A) shows the 2018 wetland delineation boundaries compared to the pre-project wetland boundaries. Appendix B contains the MDT Wetland Mitigation Site Monitoring form, the US Army Corps of Engineers (USACE) Wetland Determination Data forms for the Western Mountains, Valleys, and Coast (WMVC) Region [USACE, 2010a], and the 2008 MDT Montana Wetland Assessment (MWAM) forms. Appendix C contains photographs of the project area, Appendix D includes the surveyed stream cross sections, and Appendix E includes project plan sheets.

Based on the nature of the peat and lacustrine soils identified within the project area, the MDT Geotechnical Section indicated that constructing a new stream channel and wetlands within Schrieber Meadows could potentially affect the stability of US Highway 2. In 2007, a pilot wetland project to excavate several shallow depressional wetland cells was completed to determine constructability within these soil types. Three shallow wetland cells were created in 2007 and initially monitored in 2010. The pilot project objectives for the cells are listed below [MDT, 2009]:

- Create 2.38 acres of emergent depression wetlands within portions of existing upland hay fields by using a variety of herbaceous wetland species
- Restore (rehabilitate) 1.12 acres of degraded wetlands that are dominated by pasture grasses by permanently restoring hydrology, excavating shallow depressions, and revegetating with wetland seed
- Develop 2.96 acres of upland buffers around the created wetland areas.

The project credit ratios for the initial pilot project are shown in Table 1-1. The 3.72 acres of proposed wetland mitigation credits generated by this project have been approved by the USACE.

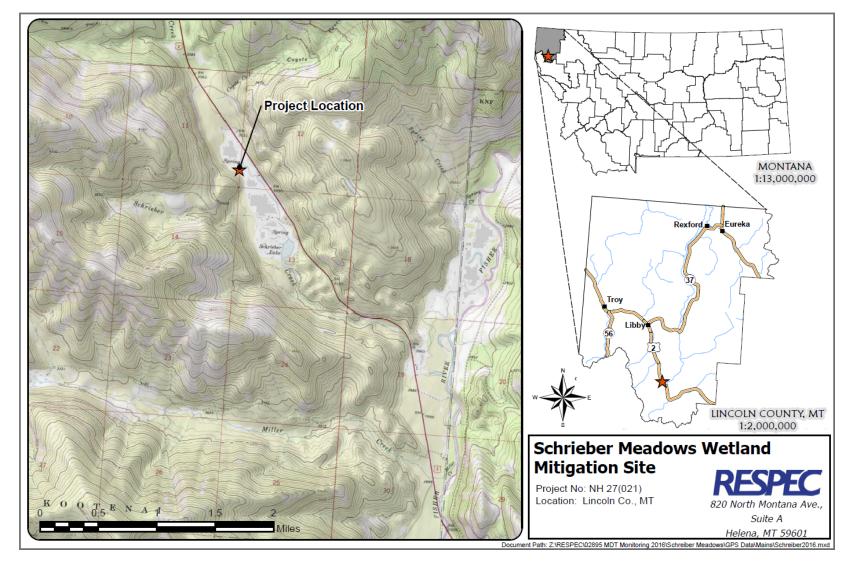

Figure 1-1. Project Location of the Schrieber Meadows Site.

Table 1-1. US Army Corps of Engineers Wetland Credit Ratios for the Schrieber Meadows Pilot Mitigation Site

Wetland Mitigation	Proposed Pilot Project Acreage	USACE- Approved Credit Ratios	Proposed Pilot Project Credit Acres	2010 Wetland Acreage	2010 Credit Acres
Creation – Northwestern Cell	0.08	1:1	0.08	0.08	0.08
Creation – Central Cell	2.01	1:1	2.01	2.01	2.01
Creation – Southeast Cell	0.29	1:1	0.29	1.63	1.63
Restoration/Rehabilitation – Southeast Cell	1.12	1.5:1	0.75	1.12	0.75
Upland Buffer (50 feet)	2.96	5:1	0.59	2.96	0.59
Total Mitigation Acreage	6.46		3.72		5.06

The Schrieber Meadows wetland and stream restoration project was scaled back from the original design based on the results of the pilot project. A 300-foot buffer was established by the MDT Geotechnical Section from the edge of the roadway, which limited potential areas of development for the new stream channel and depressional wetland areas within the project area. The existing Coyote and Schrieber Creek channels were relocated toward the western side of the property away from the highway corridor to allow for natural channel migration and overbank flooding. The restored channels' elevation was raised to promote access to the floodplain and increase the localized water table throughout this meadow. A series of wetland cells (depressions) were excavated throughout the floodplain to increase flood storage and provide for a diversity of wetland habitat. The existing Coyote/Schrieber Creek channel that is located along the eastern boundary was plugged at various locations to prevent the abandoned channel from serving as a drainage ditch and to create small pothole-like wetland areas to increase wetland diversity within the site. The overall objective for mitigation was to create and restore wetlands and to restore the natural stream sinuosity and associated riparian and floodplain corridor to Coyote and Schrieber Creeks within the US Forest Service (USFS) and MDT properties.

The construction of the Schrieber Meadows mitigation project was authorized under the authority of Section 404 of the Clean Water Act via permit #NWO-2004-90280-MTH and certification through Montana's Stream Protection Act (SPA) #MDT-R1-88-2010. A total of 3.72 mitigation credit acres were developed by pilot project construction in 2007. The acreage included creation, restoration (rehabilitation), and upland buffer credits. The entire Schrieber Meadows mitigation project encompassed creating additional depressional wetland cells and upland buffer areas around the wetlands, restoring degraded wetlands, enhancing scrub/shrub palustrine wetlands, and reconstructing portions of Coyote and Schrieber Creek channels. MDT anticipates that 17.84 wetland credit acres will be developed from the Schrieber Meadows wetland and stream restoration project, including credits that have been approved from the previous 2007 pilot project. The objectives of the full Schrieber Meadows stream and wetland restoration project are described in the following sections.

1.1 WETLAND MITIGATION OBJECTIVES

- Create 8.91 wetland credit acres of seasonally inundated, emergent depressional wetlands within portions of the existing upland hay fields on both the USFS and MDT properties with a variety of herbaceous wetland communities
- Provide approximately 2.31 wetland credit acres by restoring (rehabilitating) 3.46 acres of degraded wetlands (at a 1.5:1 ratio) that are dominated by pasture grasses such as meadow foxtail (*Alopecurus* sp.), reed canary grass (*Phalaris arundinacea*), timothy (*Phleum pratense*), and other hay species by permanently restoring hydrology, manipulating land surface (excavating shallow depressions), and revegetating with wetland plant seed
- Provide approximately 4.41 wetland credit acres by enhancing 13.22 acres of existing wetlands (at a 3:1 ratio) located between the proposed stream mitigation portion of the project area and the US Highway 2 corridor
- Provide approximately 1.70 wetland credit acres by developing upland buffers that total 8.50 acres (at a 5:1 ratio) around the created, restored, and enhanced wetland areas and stream riparian corridors
- Impact approximately 0.08 acre of wetlands by installing ditch plugs along the channelized perennial reaches of Coyote and Schrieber Creeks to divert the flows into the new stream channel
- Establish an overall total of 17.24 acres of wetland mitigation credits to mitigate wetland impacts associated with MDT projects within Watershed #1 Kootenai River Basin.

1.2 STREAM MITIGATION OBJECTIVES

- Restore approximately 7,756 linear feet of Coyote Creek stream channel, which will result in an overall increase of 3,327 linear feet of stream length by restoring sinuosity, floodplains, and natural stream migration within the project site
- Develop approximately 35,551 stream mitigation credits by restoring Coyote Creek for use within Watershed #1 – Kootenai River Basin.

Before the construction of the Schrieber Meadows project, the area consisted of hay grounds and historic wetlands that had been filled, graded, leveled, and drained. The stream channel had been channelized to promote and maximize hay production and grazing opportunities for livestock, as well as to flood irrigate the adjacent hay pastures. Historically, the project site was likely a large floodplain and beaver pond complex of mixed riparian scrub/shrub and emergent wetlands associated with both Coyote and Schrieber Creeks. Through these restoration efforts, the overall project is expected to provide increased functional ratings to the existing wetlands and stream corridor through the following:

- Improving fisheries habitat within both streams
- Relocating the streams away from the US Highway 2 corridor
- Increasing the frequency of inundation for floodplain storage across the site during high-water events
- Improving the diversity of riparian, emergent, and scrub/shrub vegetation communities through topographic and hydrologic manipulation and planting

- Restoring and raising groundwater and surface-water hydrology to restore existing degraded wetland communities
- Improving wildlife habitat across the entire project area.

Coyote Creek provides the project area with a source of seasonal and perennial surface water, along with a seasonal groundwater table within 0.5–3 feet of the preconstruction ground elevation during the spring. The seasonal groundwater is expected to provide the necessary hydrology for the majority of the created depression wetland systems. The raised bed elevation of the newly restored stream reaches is expected to promote higher groundwater elevations for a longer duration during the growing season and allow for an increased frequency of flood events to occupy newly created wetlands and riparian floodplain areas adjacent to these channels.

Stands of creeping meadow foxtail (*Alopecurus arundinacea*) and reed canary grass were removed from the site as an intended consequence of wetland cell excavation and restoration actions. The constructed wetland cells and stream banks were reseeded after the disturbance with a wetland mix and replanted with existing shrubs, trees, and plants salvaged from wetlands adjacent to the project site. Additional revegetation measures included supplemental planting of trees and shrubs with anticipation of some level of natural recruitment.

1.3 APPROVED PERFORMANCE STANDARDS

The approved performance standards for the mitigation activities are listed below [MDT, 2009].

- 1. Wetland Characteristics for all of the restored, created, enhanced, and preserved wetlands within the project limits will meet the three parameter criteria for hydrology, vegetation, and soils established for determining wetland areas as outlined in the 1987 Corps of Engineers Wetland Delineation Manual (1987 Wetland Manual) [Environmental Laboratory, 1987] and 2010 Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region (WMVC) (2010 Regional Supplement) [USACE, 2010a].
 - a. **Wetland Hydrology Success** will be achieved where wetland hydrology is present as per the technical guidelines in the 1987 Wetland Manual. Soil saturation will be present for at least 12.5 percent of the growing season.
 - b. Hydric Soil Success will be achieved where hydric soil conditions are present (per the most recent Natural Resource Conservation Service [NRCS] definitions for hydric soil) or appear to be forming, the soil is sufficiently stable to prevent erosion, and the soil is able to support plant cover. Soil sampling will be conducted during the course of the monitoring period to determine if wetland areas are exhibiting characteristics of hydric soils per the 1987 Wetland Manual. Because typical hydric soil indicators may require long periods to form, a lack of distinctive hydric soil features will not be considered a failure if hydrologic and vegetation success is achieved.
 - c. Hydrophytic Vegetation Success will be achieved where combined absolute cover of facultative or wetter species is greater than or equal to 70 percent and state-listed noxious weeds do not exceed 5 percent absolute cover. The following concept of "dominance," as defined in the 1987 Wetland Manual, will be applied during future routine wetland

determinations in created/restored wetlands: "Subjectively determine the dominant species by estimating those having the largest relative basal area (woody overstory), greatest height (woody understory), greatest percentage of aerial cover (herbaceous understory), and/or greatest number of stems (woody vines)."

- 2. Riparian Buffer Success will be achieved when woody and riparian vegetation becomes established and noxious weeds do not exceed 10 percent cover within the riparian buffer areas. Any areas within the creditable buffer area that are disturbed by the project construction must have at least 50 percent aerial cover of non-noxious weed species by the end of the monitoring period.
 - a. Vegetation Success will be achieved where combined aerial cover of riparian and stream bank vegetation communities is greater than or equal to 70 percent and state-listed noxious weeds do not exceed 10 percent cover, subject to the woody standards listed below.
 - b. **Woody Plants,** including planted trees and shrubs, will be considered successful where they exhibit 50 percent survival after 5 years.
- 3. Channel-Restoration Success will be evaluated in terms of revegetation success.
 - a. Revegetation along the new Coyote and Schrieber Creek channel corridors will be considered successful when banks are vegetated with a majority of deep-rooting riparian and wetland herbaceous and woody plant species.
 - b. The intent of the stream restoration is to allow the stream to naturally migrate within the floodplain and to give it enough room to move and stabilize itself within the site.
- 4. **Vegetation Along the Stream Banks** will be considered successful when the banks are vegetated with a majority of deep-rooting riparian plant species having root-stability indexes greater than or equal to 6 (subject to 3a and 3b above).
- 5. Open Water is expected to be provided by the project during the spring and early summer within excavated depressions. As the growing season progresses and the groundwater levels recede, vegetation is expected to germinate within the majority of the depressions. Open water with submerged and/or floating vegetation will, therefore, be considered successful and creditable.
- 6. Upland Buffer Success will be achieved when the noxious weeds do not exceed 5 percent of cover within the buffer areas on site. Any area within the creditable buffer zone that is disturbed by project construction must have at least 50 percent aerial cover of nonweed species by the end of the monitoring period.
- 7. Weed Control will be based on annual site monitoring to determine weed species and degree of infestation within the site. Control measures will be implemented by MDT based on the monitoring results to minimize and/or eliminate the intrusion of state-listed noxious weed species within the site. MDT managed the property to control known weed problems (knapweed and houndstongue) before the wetland construction activities were initiated within the site.

2.0 METHODS

The annual monitoring event was conducted on July 23-24, 2018, and represented the eighth year of monitoring for the pilot project and seventh year of monitoring of the entire Schrieber Meadows site. Information contained on the Wetland Mitigation Site Monitoring form and Wetland Determination Data forms was recorded during the field investigation (Appendix B). Monitoring activity locations were mapped by using a global positioning system (GPS) (Figure A-2, Appendix A). Data-collection activities included a wetland delineation; wetland/open water/aquatic habitat boundary mapping; vegetation community mapping; vegetation transect monitoring; soils, hydrology, and bird- and wildlifeuse documentation; photographs; stream cross sections at 11 established stations; functional assessments; and a nonengineering examination of the infrastructure established within the mitigation project area. Monitoring of this MDT mitigation site has been based on the MDT standard monitoring protocols for both stream and wetland areas that are used for all of the MDT mitigation sites for a minimum period of 5 years (or longer as determined by the USACE-Montana Regulatory Office's review of annual monitoring reports for the site and whether or not the site has met wetland and stream mitigation success criteria). Monitoring methods have remained relatively consistent at this site since the onset of monitoring. The 2012 Schrieber Meadows monitoring report [Confluence Consulting, Inc., 2012] provides a more detailed description of monitoring methods at this site. The 2012 monitoring report can be found online (https://www.mdt.mt.gov/other/webdata/external/planning/wetlands/2012/ schrieber_meadows_final_2012.pdf).

3.0 RESULTS

3.1 HYDROLOGY

Climate data from the Libby 32 SSE, Montana (245020), weather station recorded an average total annual precipitation rate of 24.44 inches from 1949 to 2017 [Western Regional Climate Center, 2018]. Annual precipitation in 2015 (21.26 inches), 2016 (21.73 inches), and 2017 (13.64) was below the long-term average. Extreme drought conditions persisted in this part of the state in 2017 and the site only received just over half of the average annual precipitation. Precipitation from January through July in 2015 (10.38 inches), 2016 (11.42 inches), 2017 (8.46 inches), and 2018 (12.02 inches) were roughly 1–5 inches below the long-term average for that time of year (13.77 inches). Based on field observations of hydrology within the site over the 8-year monitoring period, water levels within the excavated basins appear to be largely influenced by groundwater and stream discharge with moderate influence from direct precipitation. Coyote Creek upstream of the project area is intermittent and largely depends on precipitation and runoff. The percent of open water observed during 2018 remained similar to 2017 water levels.

During the 2018 investigation, the average depth of surface water across the site was estimated at 1.5 feet with a range of depths from 0 to 3 feet. Approximately 65 percent of the AA was inundated. The surface-water depth at the emergent vegetation and open-water boundary was estimated at 1.5 feet. The southern two-thirds of the site was inundated and/or saturated as a result of the reconstructed channel of Coyote Creek and abundant surface- and groundwater flowing through the valley. The high groundwater elevations found on the site are caused by a combination of restoration

efforts to plug existing drain ditches and channels as well as the subsidence of the histosol soil elevations over time. The northern portion of the site was drier. Many of the excavated wetland cells contained surface water, with the lowest or absent water levels near the northern boundary. The intermittent Coyote Creek was dry in July 2018 north of the spring, just upstream of the site's access road. This spring appears to provide a perennial source of hydrology to the site. Direct precipitation also contributes to wetland hydrology, but the high seasonal groundwater table provides the majority of water that drives wetland hydrology within this site. Above-average precipitation rates, such as those observed in 2011, 2012, and 2014, slowly flow off the site as excess surface water after being captured and stored on the site. Other site-wide indicators of wetland hydrology included saturation and inundation that is visible on aerial photographs, geomorphic positions, positive facultative -neutral (FAC-neutral) test, and a seasonal high groundwater table.

Three matched sets of wetland/upland data points were sampled in 2018 to determine the wetland/upland boundaries across the site. Two new matched sets were added in 2018 as a result of changes to the USACE wetland delineation requirements. DP-1W is located near an excavated wetland cell near the center of the site (Figure A-2, Appendix A). This wetland data point exhibited a high-water table, geomorphic position (valley bottom at toe of slope), and a positive FAC-neutral test. DP-1U is located upslope (west) from DP-1W. No hydrologic indicators were observed at DP-1U. DP-2W, which is a new data point for 2018, is located in the northwestern part of the site in an area that receives seasonally high groundwater and has a positive FAC-neutral test. DP-2U is located upslope (west) from DP-2W. No hydrologic indicators were observed at DP-2U. DP-3W is also a new point in 2018 and is located in the northeast corner of the site in a man-made depression. One inch of standing water was recorded at this datapoint during the July field survey. DP-3U is located upslope from DP-3W. No hydrologic indicators were observed at DP-3U.

3.2 CHANNEL CROSS SECTIONS

The survey results for 11 permanent cross sections that were established along the constructed Coyote and Schrieber Creeks (Figure A-2, Appendix A) are shown in Appendix D. The 2017 data was compared to the previous surveys and discussions to assess stream channel stability. In general, the banks of the constructed channels were well-vegetated and exhibited stable conditions. Consequently, no major channel morphological changes have been observed throughout all of the monitoring years.

As stated in the 2015 monitoring report [Confluence Consulting, Inc., 2015], with the exception of Cross-Sections 3, 9, and 10, minimal changes were observed within the surveyed cross-section geometry between 2012 and 2015. The 2015 monitoring report provided the following discussion with respect to Cross-Section 3:

XS 3 was located directly below a spring in the reach of a channel that remained undisturbed during mitigation construction in 2011. In 2014, a review of the XS 3 survey data indicated a discrepancy related to an inability to find the bank pins in 2013 and 2014; the difference in the surveys for those years do not reflect an actual change in channel morphology at this location. The 2015 survey was accurately located at XS 3 and demonstrates no effective change in-stream channel morphology from 2012 through 2015.

The 2018 survey was also accurately located for Cross-Section 3. Between the 2016, 2017, and 2018 surveys, the plots provided in Appendix C show similar channel geometry.

The 2015 monitoring report provided the following discussion with respect to Cross-Section 9:

The survey at XS 9 from 2013 to 2014 was intentionally mislocated upstream or downstream of the 2012 survey location to avoid disturbing channel morphology and large woody debris that had been installed after the 2012 survey. The 2013 and 2014 survey data was taken outside the zone of influence of the installed woody debris; these data document that the channel is stable near XS 9, which is a circumstance that continues to the present. In 2015, the survey data were collected at the original 2012 XS 9 location to document the effect of the woody debris: a general widening without deepening the channel.

The 2016, 2017, and 2018 surveys were also performed at the original 2012 Cross-Section 9 location. As observed in the cross-sectional plots in Appendix C, the widening that was observed in 2015 appears to have narrowed to approximately the same width upstream and downstream as shown in the 2013 and 2014 surveys.

The 2015 monitoring report provided the following discussion with respect to Cross-Section 10:

The permanent bank pins could not be located at XS 10 during the 2013 and 2014 surveys because of a robust stand of reed canary grass that obscured the ground surface. A XS survey was completed at the approximate location; however, postprocessing of the GPS survey data indicated that the survey was approximately 10 feet from the established pins. In 2015, the bank pins were located, and the original alignment of XS 10 was surveyed. Survey data and site photographs document that the site is well-vegetated and stable and that the apparent minor adjustment in channel morphology is as likely caused by survey error and marshy substrate conditions as by actual movement. Photographs in Appendix C show well-established reed canary grass stands at this XS with no erosion identified during the field survey.

The 2016 survey of Cross-Section 10 was also complicated by the robust stand of reed canary grass that obscured the ground surface. The left bank monument was located and surveyed as the same location in 2015. However, the right bank monument was not located, which resulted in a different cross-section orientation than collected in 2015. Both bank monuments were located during the 2017 and 2018 surveys, which closely resemble the 2015 section.

Water surface elevations in 2017 and 2018 showcased the highest water levels throughout the sites monitoring history. Several factors may be attributed to the water level on the site including recent precipitation, groundwater elevation and annual cumulative precipitation, and time of year the site was surveyed. One exception is Cross-Section 3, which showed a slightly lower water surface elevation in 2018 when compared to the 2017 survey. This section is located just upstream of a culvert through a road crossing. It is possible the culvert was partially plugged in 2017 but cleared before the 2018 survey. A smaller culvert opening could create higher headwater elevation for a lesser or equal flow rate. As observed in previous monitoring years, the 2018 channel survey revealed a stable channel throughout all monitoring cross sections. The robust vegetation establishment with species that possess high root-stability indices observed at all of the cross sections are likely the source of the overall stable banks that were observed throughout the monitoring years.

3.3 VEGETATION

A comprehensive list of 136 plant species identified on the site from 2010 through 2018 is presented in Table 3-1. No new plant species were observed in 2018. Six wetland and two upland community types were identified and mapped at the mitigation site in 2018 (Figure A-3, Appendix A). Individual plant species that were observed within each community are listed on the Wetland Mitigation Site Monitoring form (Appendix B). Open water below the ordinary high-water mark (OHWM) of the constructed stream channel is identified on Figure A-3 (Appendix A) by Polygon 10. The vegetation community types that were identified on the site in 2018 are discussed below.

Wetland community Type 3 – *Phalaris arundinacea* was the largest vegetation community on the site in 2018 and covered 29.93 acres of the project area. This community type increased by 4.6 acres in 2018 over 2017 because it replaced wetland community Type 6 – *Alopecurus pratensis/Agrostis capillaris* across some of the northern part of the site. Reed canary grass dominated the community and was over 6 feet tall in some areas. Standing water intermixed with vegetation was common within this vegetation community type in 2018. Speckled alder (*Alnus incana*), stalk-grain sedge (*Carex stipata*), and water smartweed (*Persicaria amphibia*) were present at 1–5 percent cover. Portions of this community type are seeing a shift in species dominance from reed canary grass to sedge because of prolonged saturation and standing water on the site. Portions of this community type are expected to continue to shift as the wetland continues to develop.

Wetland community Type 5 – Aquatic Macrophytes/Open Water encompassed 11.15 acres of the site in 2018, which is unchanged from 2017. This community type is associated with all wetland cells that were constructed in 2011, historic hay pastures that are now perennially inundated, and the cutoff Coyote Creek channel that runs along the eastern project boundary. Aquatic plant development largely varies in the constructed cells depending on whether the water regime within the cell was intermittent or perennial. In general, the cells located toward the northern boundary (upgradient) were susceptible to a higher level of groundwater fluctuation and displayed intermittent conditions. Vegetation within these cells was composed of algae and sparse emergent vegetation. Inundation levels within the constructed cells increased at the downgradient end of the site near the southern boundary where the water regime is perennial. Aquatic plant cover was much higher in these wetter cells and included brown and green algae, muskgrass (*Chara* sp.), water smartweed, Nebraska sedge (*Carex nebrascensis*), common spike-rush (*Eleocharis palustris*), and reed canary grass. Other species that were observed include broad-leaf cattail (*Typha latifolia*), American mannagrass (*Glyceria grandis*), and common duckweed (*Lemna minor*). A total of 11 dominant species were identified within this community in 2018. Open water and bare ground each accounted for 21–50 percent of the community.

Wetland community Type 6 – *Alopecurus pratensis/Agrostis capillaris* was located across 1.72 acres that surround constructed Cells 2, 5, 6, 7, 8, and 9 along the upper Coyote Creek reach. The area appeared to be exposed to periodic flooding during peak spring runoff with seasonal drawdown and drier conditions present throughout the latter part of the growing season. The community was dominated by field meadow foxtail and colonial bent (*Agrostis capillaris*), with lesser cover provided by reed canary grass, smooth brome (*Bromus inermis*), Kentucky bluegrass (*Poa pratensis*), slenderbeak sedge (*Carex athrostachya*), fringed willowherb (*Epilobium ciliatum*), and two other sedge species.

Table 3-1. Vegetation Species Identified in 2010 and From 2012 Through 2018 at the Schrieber Meadows Site (Page 1 of 4)

Common Names	Scientific Names	WMVC Indicator Status ^(a)
Common Yarrow	Achillea millefolium	FACU
Nelson's Rice Grass	Achnatherum nelsonii	UPL
Nettle-Leaf Giant-Hyssop	Agastache urticifolia	FACU
Crested Wheatgrass	Agropyron cristatum	UPL
Wheatgrass	Agropyron sp.	UPL
Colonial Bent	Agrostis capillaris	FAC
Black Bent	Agrostis gigantea	FAC
Rough Bent	Agrostis scabra	FAC
Spreading Bent	Agrostis stolonifera	FAC
Algae, brown	Algae, brown	NL
Algae, green	Algae, green	NL
Northern Water-Plantain	Alisma triviale	OBL

⁽a) 2016 NWPL [Lichvar et al., 2016].

Wetland community Type 7 – *Juncus bufonius*/Bare Ground was located on 0.41 acre in 2018. Community Type 7 was mapped in the lower contours of excavated wetland Cell 1 in the far northwestern corner of the mitigation area. Toad rush (*Juncus bufonius*) dominated this vegetation community. American slough grass (*Beckmannia syzigachne*), common spike-rush, seep monkeyflower (*Mimulus guttatus*), paiuteweed (*Suaeda calceoliformis*), and three other species were observed in 2018. Approximately 21–50 percent of the community was bare ground, which is a result of fluctuating water levels in the excavated wetland cells.

Upland community Type 8 – *Elymus repens/Pascopyrum smithii* was mapped across 2.68 acres within the spoil pile from both the Schrieber Meadows and Schrieber Lake mitigation projects. MDT continues to use topsoil from this location to revegetate highway reconstruction projects along US Highway 2 near Schrieber Meadows. Creeping wild rye (*Elymus repens*), western wheatgrass (*Pascopyrum*

smithii), and black medick (*Medicago lupulina*) dominated the community. Other species included field meadow foxtail, smooth brome, and tall hedge-mustard (*Sisymbrium altissimum*).

Upland community Type 9 – *Alopecurus* spp./*Bromus inermis* was located across 6.85 acres within uplands around the periphery of the site. Community Type 9 consisted of field meadow foxtail, creeping meadow foxtail, and smooth brome, with lesser cover provided by common yarrow (*Achillea millefolium*), western-wheat grass, Kentucky bluegrass, stout meadow ragwort (*Senecio hydrophiloides*), leafy leopardbane (*Arnica chamissonis*), and common dandelion (*Taraxacum officinale*).

Wetland community Type 13 – *Eleocharis palustris*/Bare Ground characterized 1.5 acres of wetland within the perimeter of the wetland cells in the northern section of the site. Bare ground represented 21–50 percent of the cover within the community because of fluctuating water levels. This community occurs primarily within the bottom of wetland cells. Open water was not observed in this community in 2017. Common spike-rush, field meadow foxtail, and American slough grass dominated this community, with lesser cover provided by woolly sedge (*Carex pellita*), bulrush (*Scirpus* sp.), and 30 other species.

Upland community Type 14 – *Agrostis capillaris/Phleum pratense* was observed for the first time in 2015 and replaced community Type 12 – *Agrostis stolonifera/Juncus bufonius* on 2.3 acres located in USFS property that is in the northwestern corner of the site. Colonial bent and common timothy (*Phleum pratense*) dominated the vegetation cover in 2018, with lesser cover from 10 additional species. This community contained a trace amount of orange hawkweed (*Hieracium aurantiacum*), which is a Priority 2A noxious weed, and a low amount of ox-eye daisy (*Leucanthemum vulgare*), which is a Priority 2B noxious weed in previous years surveys.

Five vegetation communities were identified during the initial monitoring of the Schrieber Meadows pilot project in 2010. In 2018, the site had six wetland vegetation communities and two upland communities, which indicates that dominant plant communities are continuing to evolve across the site. Changes in vegetation communities from 2010 through 2018 were primarily caused by continued wetland vegetation development within and around the excavated cells, vegetation response to the increased groundwater table, and mapping refinement of community boundaries. Overall, the vegetation communities at this site have remained relatively stable over the last 2–3 years with the principal changes occurring around the constructed cells in the northern part of the site and within areas of prolonged inundation in the old hay meadows that have drowned out reed canary grass.

Trends in plant species composition were measured along three belt transects (T-1, T-2, and T-3) in 2018. Photographs of the transect end points are provided in Appendix C. One 318-foot transect (T-1) was established during initial monitoring at the site in 2010. Table 3-2 and Charts 3-1 and 3-2 summarize the data for T-1 (Wetland Mitigation Site Monitoring form, Appendix B). T-1 intersected vegetation community Types 3 – *Phalaris arundinacea* and 5 – Aquatic Macrophytes/Open Water. Hydrophytic vegetation accounted for 19.8 percent of the transect in 2018. Open water accounted for 80.2 percent of the transect. This transect has not intersected any upland vegetation communities from 2012 through 2018.

Table 3-2. Data Summary for T-1 in 2010 and From 2012 Through 2018 at the Schrieber Meadows Site

Monitoring Year		2012	2013	2014	2015	2016	2017	2018

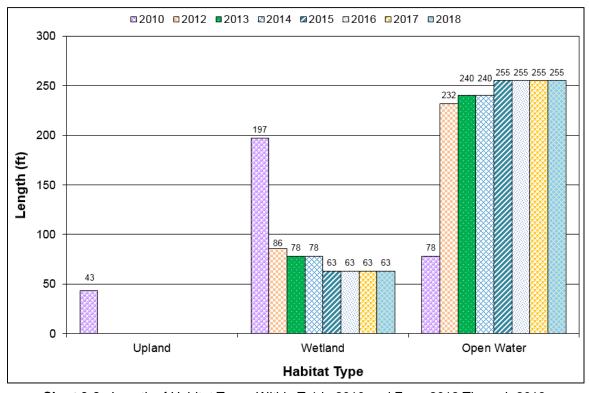

Chart 3-2. Length of Habitat Types Within T-1 in 2010 and From 2012 Through 2018.

T-2 was established in 2011 across three constructed cells within the northwestern section of the project site (Figure A-2, Appendix A). The data recorded on T-2 (Wetland Mitigation Site Monitoring form, Appendix B) are summarized in tabular and graphical formats in Table 3-3 and Charts 3-3 and 3-4, respectively. T-2 extends 594 feet from west to east across wetland Cells 2A, 3A, and 4A. The transect intervals alternated between wetland community Types 5 – Aquatic macrophytes/Open Water, 6 – *Alopecurus pratensis/Agrostis capillaris*, 13 – *Eleocharis palustris/*Bare Ground, and 14 – *Agrostis capillaris/Phleum pratense*. Hydrophytic vegetation composed approximately 58.1 percent of the transect during the 2017 survey. A total of 35 species were identified, including 30 hydrophytes and 5 upland species. Open water and mudflat represented 18.7 and 23.2 percent of the transect intervals, respectively. The percent of open water observed during 2018 was an 11 percent increase from 2017 water levels.

Table 3-3. Data Summary for T-2 From 2012 Through 2018 at the Schrieber Meadows Site

Monitoring Year	2012	2013	2014	2015	2016	2017	2018

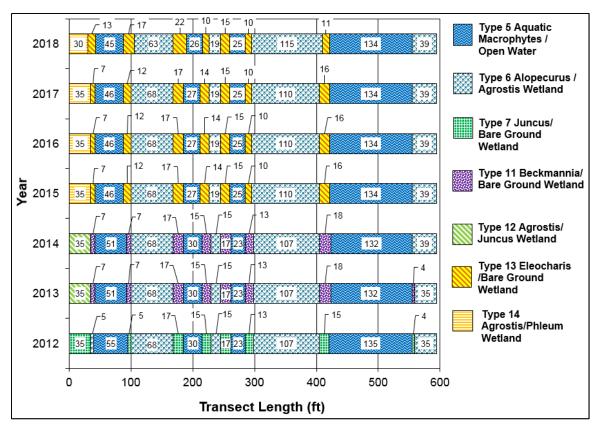

Chart 3-3. Transect Map Showing Community Types on T-2 From 2012 Through 2018 From Start (0 Foot) to Finish (594 Feet).

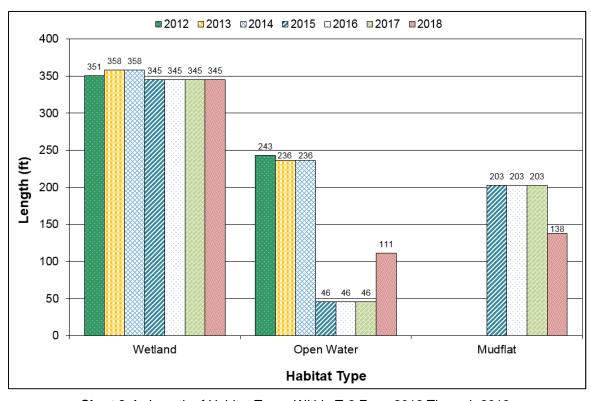

Chart 3-4. Length of Habitat Types Within T-2 From 2012 Through 2018.

T-3 begins near constructed wetland Cell 8 along the Middle Coyote Creek reach and extends east 440 feet to the edge of the former Coyote Creek channel along the eastern site boundary. The data recorded on T-3 (Wetland Mitigation Site Monitoring form, Appendix B) are summarized in tabular and graphical formats in Table 3-4 and Charts 3-5 and 3-6, respectively. The transect intervals alternated between wetland community Types 3 – *Phalaris arundinacea* and 5 – Aquatic macrophytes/Open Water. Hydrophytic vegetation composed approximately 48 percent of the transect during the 2018 survey. Only 12 plant species were identified on the transect as a result of the dominance by reed canary grass within this area. Open water represented 52 percent of T-3, which is similar to the percent in 2017.

Table 3-4. Data Summary for T-3 From 2012 Through 2018 at the Schrieber Meadows Site

Monitoring Year	2012	2013	2014	2015	2016	2017	2018

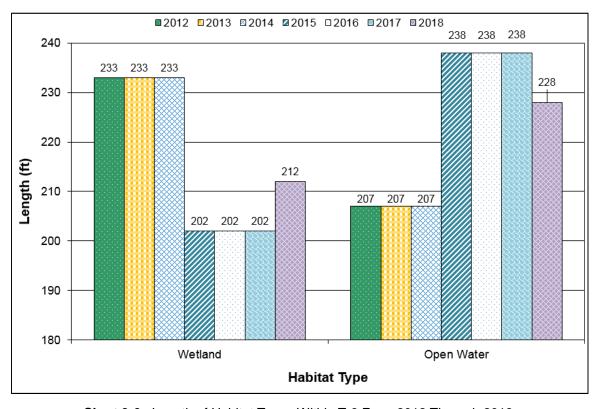

Chart 3-6. Length of Habitat Types Within T-3 From 2012 Through 2018.

Canada thistle is the primary state-listed Priority 2B noxious weed found in disturbed upland habitat across the site. Ox-eye daisy, houndstongue, and spotted knapweed are additional noxious species that have been identified across the site over the last 8 years but were not encountered in 2018. Weed infestations occur primarily within upland communities around the perimeter of the site with only a few occurring with the interior of the site. A weed contractor with MDT treated these areas during May 2018. MDT has an ongoing weed-control program for their mitigation sites that includes an annual assessment of weeds identified at each location and treatment to contain and control identified populations.

A total of 1,000 speckled alders (*Alnus incana*) were planted along the newly constructed stream channel and wetland cells in the northern third of the site. Fewer than 50 live plants were observed throughout the mitigation site in 2018, which indicates 5 percent survival. Fewer than 10 willows (*Salix* spp.) were observed near the spring north of the access road. Several of the alder trees were resprouting from the roots, while the aboveground portions of the plants were dead. The remaining alders and willows appeared to be doing well in 2018 and are expected to persist. The prevalence of reed canary grass and a high-water table is likely inhibiting shrub development within much of this site. The excavated depressions on the USFS parcel provide a suitable environment for woody plant establishment and some individual willows have been recorded along T-2 and around the edges of excavated wetland cells. These plants have not matured to date.

3.4 SOIL

The primary map unit on the site (approximately 70 percent) was identified as a poorly drained Aquic Udifluvent. The soil is found in intermontane basins and is classified as hydric. The NRCS soil unit Andic Dystric Eutrochrepts was mapped in the lower portions of the site and included silty glaciolacustrine deposits common on lacustrine terraces and glacial outwash terraces [US Department of Agriculture, 2016].

Soil test pits were excavated at six locations to evaluate the extent of hydric soil development. DP-1W is located in wetland community Type 3 – *Phalaris arundinacea* in the center of the site, and DP-1U is located upslope of DP-1W in upland community Type 9 – *Alopecurus* spp./*Bromus inermis*. At DP-1U, the upper layers of the soil profile revealed a 2-inch layer of organics and duff above a layer of black (10YR 2/1) silt. DP-1W revealed 18 inches of black (10YR 3/1) loam and silt loam with 2 percent dark yellowish brown (7.5YR 4/6), redoximorphic concentrations in the matrix. The soil meets the criteria for Depleted Matrix (F3) and classification as a hydric soil.

DP-2W is located in wetland community Type 3 in the northwest portion of the site, and DP-2U is located upslope of DP-2W in upland community Type 9. At DP-2U, the upper 20 inches of the soil profile revealed a very dry 2.5Y 5/3 silt loam. DP-2W revealed 6 inches of brown silt loam above a very dark (10YR 2/1) layer of clay loam. The soil met the criteria for Thick Dark Surface (A12) and classification as a hydric soil.

DP-3W is located in wetland community Type 5 in the northeast corner of the site, and DP-3U is located upslope of DP-3W in upland community Type 9. At DP-3U, the soil profile revealed 10 percent redox features in the upper 14 inches of the profile and technically qualified as hydric soil but the

vegetation is dominated by upland grasses. This area may have previously qualified as wetland but has dried up over time. DP-3W revealed 16 inches of grayish (10YR 5/1) clay with 5 percent 10YR 5/6 redoximorphic concentrations in the matrix. The soil met the criteria for Depleted Matrix (F3) and classification as a hydric soil.

3.5 WETLAND DELINEATION

The wetland delineations that were conducted in 2004 and 2005 before project initiation identified four different wetland areas that totaled approximately 15.56 acres within the mitigation project area. The pilot project that was constructed in 2007 resulted in an additional 2.38 acres of wetland habitat being developed within the project boundary. After the second construction phase was complete, the delineation that was conducted in 2012 mapped a total of 47.58 acres of wetlands across the 56.95-acre site. The total wetland acreage that was delineated from 2013 through 2017 decreased slightly in 2018 from 47.95 acres to 47.42 acres. The slight decrease could be within the surveying margin of error of the wetland boundaries; however, the extreme northeast end of the site appears to be drying out somewhat and a noticeable movement of the wetland delineation line occurred near DP-3U in 2018. Whether prolonged drought conditions are responsible for this shift or other underlying factors is unclear. The extensive development of wetlands at this site was the product of excavating the wetland cells, plugging the former Coyote Creek channel and man-made drainage ditches, and raising the bed elevation of the restored creek channel. Widespread inundation was present throughout the southern two-thirds of the site as a result of the earthen ditch plugs and the impedance of surface drainage out of the site. The site was inundated extensively below the access drive. Openwater riverine habitat associated with the restored stream channel was defined on approximately 0.34 acre of the site. (Note that the restored stream channels are not creditable under wetland credits because they are being credited as stream mitigation credits.) A total of 47.42 acres of jurisdictional wetland were delineated at the Schrieber Meadows site in 2018, as shown in Table 3-5.

Table 3-5. Total Wetland Acres Delineated in 2010 and From 2012 Through 2018 at the Schrieber Meadows Site

Wetland Habitat Type	2010 (acres)	2012 (acres)	2013 (acres)	2014 (acres)	2015 (acres)	2016 (acres)	2017 (acres)	2018 (acres)
Preexisting wetland area inside geotechnical limits adjacent to US Highway 2 (MDT & USFS)	1.12	15.56	15.56	15.56	15.56	15.56	15.56	15.56
Created wetland depressions and additional wetland development	3.72	32.02	32.05	32.05	32.05	32.05	32.05	31.52
Open-water riverine habitat	0.00	0.34	0.34	0.34	0.34	0.34	0.34	0.34
Total Wetland Habitat	4.84	47.92	47.95	47.95	47.95	47.95	47.95	47.42

3.6 WILDLIFE

A list of animal species that were directly or indirectly observed in 2010 and from 2012 through 2018 is presented in Table 3-6. A total of 15 different bird species were identified at the site in 2018. Other wildlife observations in 2018 include white-tailed deer, elk tracks, and two fish species.

Table 3-6. Wildlife Species Observed at the Schrieber Meadows Site in 2010 and From 2012 Through 2018 (Page 1 of 2)

Common Name	Scientific Name
Атр	phibians
Columbia Spotted Frog	Rana luteiventris
Frog sp.	
Pacific Treefrog	Pseudacris regilla
Western Toad	Bufo boreas
E	Birds
American Coot	Fulica americana
American Robin	Turdus migratorius
American Wigeon	Anas americana
Bank Swallow	Riparia riparia
Barn Swallow	Hirundo rustica
Belted Kingfisher	Megaceryle alcyon
Black-Billed Magpie	Pica
Black-Capped Chickadee	Poecile atricapillus
Blue-Winged Teal	Anas discors
Brewer's Blackbird	Euphagus cyanocephalus
Canada Goose	Branta canadensis
Cedar Waxwing	Bombycilla cedrorum
Cinnamon Teal	Anas cyanoptera
Cliff Swallow	Petrochelidon pyrrhonota
Common Raven	Corvus corax
Common Yellowthroat	Geothlypis trichas
Dusky Flycatcher	Empidonax oberholseri
Eared Grebe	Podiceps nigricollis
Eastern Kingbird	Tyrannus tyrannus
Gadwall	Anas strepera
Great Blue Heron	Ardea herodias
Greater Yellowlegs	Tringa melanoleuca
Green-Winged Teal	Anas crecca
Killdeer	Charadrius vociferus
Lesser Yellowlegs	Tringa flavipes
Mallard	Anas platyrhynchos
Marsh Wren	Cistothorus palustris
Osprey	Pandion haliaetus
Redhead	Aythya americana
Red-Tailed Hawk	Buteo jamaicensis
Red-Winged Blackbird	Agelaius phoeniceus
Rufous Hummingbird	Selasphorus rufus

Elk or Wapiti	Cervus canadensis									
Gray Wolf	Canis lupus									
Ground Squirrel										
Meadow Vole	Microtus pennsylvanicus									
Moose	Alces americanus									
Muskrat	Ondatra zibethicus									
Raccoon	Procyon lotor									
White-Tailed Deer	Odocoileus virginianus									
Yellow-Pine Chipmunk	Tamias amoenus									

Species that were identified in 2018 are in bold.

3.7 FUNCTIONAL ASSESSMENT

The 2008 MDT MWAM was used to evaluate the site in 2010 and 2012 through 2018. The functional assessment that was completed in 2010 incorporated the three constructed wetland cells and enhanced wetlands into one AA. These wetlands received a Category II rating with 68 percent of the total possible points in 2010. In 2012, the acreage of the project area increased to include the additional constructed wetland cells, restored wetlands, and enhanced wetlands. These additions resulted in the assessment of three separate AAs from 2012 to 2018; these assessments are summarized in Table 3-7. The score for listed/proposed threatened and endangered (T&E) species habitat function was increased to high because of the presence of grizzly bears in the area as reported by Montana Fish, Wildlife, and Parks Department (MFWP) and US Fish and Wildlife Service (USFWS) biologists in 2015 and 2016.

The 2012–2018 restoration AA included 3.46 acres of preexisting wetlands within the footprint of the excavated cells. The AA includes both aquatic bed and emergent wetland habitats. During 2015, the assessment score increased by 8 percent and the functional units totaled 28.37. The scores remained similar in 2018. The AA is rated as a Category I wetland and scored excellent for general wildlife habitat and production export/food chain support and high for listed/proposed T&E species habitat, Montana Natural Heritage Program (MTNHP) species habitat, short- and long-term surface-water storage, sediment/shoreline stabilization, groundwater/discharge/recharge, and recreation/education potential. Production export/food chain support shifted from a moderate to excellent rating in 2015 because of the observation of an unrestricted water surface outlet to Coyote Creek. General wildlife habitat shifted from a high to an excellent rating for this AA in 2015 because of the change in disturbance rating from moderate to low.

The 2012–2018 enhancement AA included 13.22 acres of preexisting wetlands between the Coyote Creek stream restoration and US Highway 2. The AA is comprised of seasonally and permanently inundated emergent wetland habitat. Functional units in the AA totaled 115.01 in 2018. The AA is rated as a Category I wetland and scored excellent for general wildlife habitat and production export/food chain support and high for Montana Natural Heritage Program (MTNHP) species habitat, short- and long-term surface-water storage, sediment/shoreline stabilization, groundwater/discharge/recharge, and recreation/education potential.

The 2012–2018 creation AA included 22.43 acres of created wetlands across the site. The AA is comprised of seasonally inundated emergent wetland and permanently inundated aquatic bed habitat. Functional units in the AA totaled 208.55 in 2018. The AA is rated as a Category I wetland and scored excellent for general wildlife habitat and production export/food chain support and high for Montana Natural Heritage Program (MTNHP) species habitat, short- and long-term surface-water storage, sediment/shoreline stabilization, groundwater/discharge/recharge, and recreation/education potential.

3.8 PHOTOGRAPHIC DOCUMENTATION

Ten photo points were initially established within the three constructed cells that were monitored in 2010. A total of 20 photo points were established in 2012 in response to the increased project area size, including the reestablishment of Photo-Point 7 from its original 2010 location. In addition to established photo points, photographs were taken at each surveyed stream cross section, sampled data points, and vegetation transect endpoints. The locations of these photographs are illustrated on Figure A-2 (Appendix A) and the photographs in Appendix C.

3.9 MAINTENANCE NEEDS

No man-made water-control structures were installed on the property. Two nest boxes were in place on the fence posts at the site entrance gate. The boxes were in good condition with signs of continued use. Weed-control activities were conducted on May 30, 2018. Weed spraying has been conducted annually within the site to eliminate the predominant Canada thistle infestations. MDT has an ongoing weed-control program for their mitigation sites that includes an annual assessment of weeds identified at each location and treatment to contain and control identified populations.

3.10 CURRENT CREDIT SUMMARY

3.10.1 Wetland Mitigation Credit

The pilot project was constructed in 2007 and generated approximately 3.72 mitigation credit acres, including 2.38 credit acres of wetland creation, 0.75 credit acre for restoring (rehabilitating) of existing wetlands (1.12 acres restored), and 0.59 credit acre of upland (2.96 acres maintained) buffer around the wetlands. The pilot project was engulfed by the larger project constructed by MDT in 2011. Table 3-8 provides the credits generated at the Schrieber Meadows site for the approximately 57-acre, full-scale project and does not differentiate between the pilot project and full build-out of the Schrieber Meadows project.

Approximately 17.24 wetland credit acres were anticipated to be generated from the full build-out of the Schrieber Meadows project, including the approved credits from the 2007 pilot project. The proposed wetland credits that are shown on Table 3-8 are described below. Approximately 8.91 acres of wetlands were predicted to be created by excavating Cells 1–11 (Appendix E). The acreages that were delineated from 2013 through 2018 indicated that 21.90 acres of wetland habitat have been created within this site. Note that water levels have substantially increased because of the newly constructed channel of Coyote Creek and abundant surface- and groundwater that flows through the valley. The high groundwater elevations found on the site are caused by a combination of restoration efforts to plug existing drain ditches and channels as well as the subsidence of the histosol soil elevations over time. All of the wetlands within the 25-foot riparian buffer (8.30 acres) that were used to calculate stream mitigation credits were subtracted from total wetland habitat to avoid doubly calculating the total mitigation credits at this site.

30 DRAFT

Project Impacts	-0.08	None	-0.08	-0.08	-0.08	-0.08	-0.08	-0.08	-0.08	-0.08	-0.08	-0.08	-0.08	-0.08	-0.08
Total Mitigation Acreage	34.01		17.25	59.72	31.54	59.72	31.54	59.72	31.54	59.72	31.54	59.72	31.54	59.72	31.01

 ⁽a) Riparian buffer areas were used to calculate stream and riparian credits.
 (b) Wetland acreages within riparian buffer were subtracted from wetland credit total; riparian buffer does not include upland buffer acreage. Acreage includes 50-foot buffer around wetlands within MDT and USFS property and outside of the riparian buffer.

A total of 2.31 acres of wetland credit was to be generated from restoring 3.46 acres of wetlands within a small portion of the USFS property and a portion of MDT property in wetland Cells 4, 5, 8, 9, 10, and 11 (Appendix E). A total of 4.41 acres of wetland credit have been generated by hydrologically enhancing 13.22 acres of existing wetlands between the stream mitigation portion of the project area and the US Highway 2 corridor.

Approximately 2.48 acres of mitigation credit have been generated by preserving 50-foot upland buffers around the perimeter of the wetland boundary. Upland buffer credit was given to areas on MDT and USFS property and outside of the 25-foot riparian buffer. Developing this mitigation site resulted in impacts to 0.08 acre of wetland because of ditch plug installation. The 0.08 acre was debited from the estimated credit acreages. Overall, the 17.24 proposed credit acres have been surpassed by developing 31.01 acres, which created a surplus of 13.77 credit acres.

The current site conditions that were documented in 2018 are compared to the approved performance standards and success criteria in Table 3-9. The wetlands that were delineated in 2018 met the performance standards approved for this site, which included meeting the three parameter criteria for hydrology, vegetation, and soils. Hydrophytic vegetation success has been achieved based on the absolute cover of facultative or wetter species being greater than or equal to 70 percent. Open-water areas were given full credit based on the stated goal of the project to provide open water within the excavated depressions during the spring and early summer. Weed cover site-wide and within the upland buffers did not exceed 5 percent and met the success criteria. Isolated weed infestations were mapped throughout the mitigation site and are controlled by MDT as mandated by the performance standards. The upland buffer success criteria have been achieved because these areas have at least 50 percent aerial cover of nonweed species and noxious weeds do not exceed 5 percent cover.

3.10.2 Stream Mitigation Credit

As discussed in this report's introduction, the goal of the stream mitigation component of the Schrieber Meadows project was to restore approximately 7,756 linear feet of new stream channel in both Coyote and Schrieber Creeks to result in an overall increase of 3,327 linear feet of stream length with the development of approximately 35,551 stream mitigation credits. The stream mitigation project has been separated into the following five distinct segments:

- Upper Coyote Creek is the segment from the edge of the forested areas on and through the USFS parcel onto the MDT-owned parcel and is considered a seasonally intermittent stream. This segment of stream does not become perennial again until it reaches the spring area on the MDT property.
- Coyote Creek Spring Area is located between the USFS restored segment of stream and the
 access road into the MDT site. A large spring emanates from this location; MDT did not
 manipulate this area except to plant woody shrubs and trees in the adjacent riparian zones.
- Middle Coyote Creek begins at the culverts under the access road and extends to its
 connection with Schrieber Creek. The stream is perennial because of groundwater flows that
 emanate from the spring area.

Table 3-9. Summary of Performance Standards and Success Criteria at Schrieber Meadows in 2018 (Page 1 of 2)

Performance Standards	Success Criteria	Criteria Achieved Y/N	Discussion
Wetland Characteristics	The three parameter criteria for hydrology, vegetation, and soils are met as outlined in the 1987 Wetland Manual and the 2010 Regional Supplement.	Y	Areas that were identified as wetland habitat within the mitigation site meet the three parameter criteria.
Wetland Hydrology	Soil saturation is present for at least 12.5 percent of the growing season.	Y	Areas that were identified as wetland habitat within the mitigation site exhibit soil saturation for a minimum 12.5 percent of growing season.
	Hydric soil conditions are present or appear to be forming.	Υ	Hydric soil characteristics have developed throughout a majority of the constructed wetlands.
Hydric Soil	Soil is sufficiently stable to prevent erosion.	Y	Disturbed soil is stable and does not exhibit signs of erosion.
	Soil is able to support plant cover.	Y	Plant cover is well established across disturbed soils.
Hydrophytic	Combined absolute cover of facultative or wetter species is 70 percent or greater.	Y	Areas that were identified as wetland habitat within the mitigation site support a prevalence of hydrophytic vegetation (OBL, FACW, and FAC).
Vegetation	State-listed noxious weeds do not exceed 5 percent absolute cover.	Y	State-listed noxious weeds are estimated well below 5 percent absolute cover within wetland areas.
	Woody and riparian vegetation is established.	N	No woody-dominated communities have formed along the established riparian buffer; riparian vegetation (primarily reed canary grass) has been established.
	Noxious weeds do not exceed 10 percent cover within the riparian buffer areas.	Y	State-listed noxious weeds are estimated at 1–3 percent absolute cover within riparian buffer.
	Creditable buffer areas must have at least 50 percent aerial cover of non-noxious weed species by the end of the monitoring period.	Y	Non-noxious vegetation consists of nearly 100 percent of total vegetation cover within riparian buffer.
Riparian Buffer Success	Combined aerial cover of riparian and stream bank vegetation communities is 70 percent or greater.	Y	Riparian and stream bank vegetation communities support nearly 100 percent cover.
	Planted trees and shrubs will be considered successful where they exhibit 50 percent survival after 5 years.	N	After plantings, the majority of the site supported standing water and likely drowned out 90 percent of the plantings by the end of the second growing season. Approximately 3 percent survival was noted in 2018. MDT is currently working with the USFS Kootenai National Forest to coordinate a replanting plan in appropriate riparian buffer areas within the site that are not inundated by highwater levels.

Table 3-9. Summary of Performance Standards and Success Criteria at Schrieber Meadows in 2018 (Page 2 of 2)

Performance Standards	Success Criteria	Criteria Achieved Y/N	Discussion
Channel- Restoration Success	Revegetation along the new Coyote and Schrieber Creek channel corridors will be considered successful when banks are vegetated with a majority of deep-rooting riparian and wetland herbaceous and woody plant species.	Y	The majority of streambank vegetation along the constructed Coyote and Schrieber Creek channel corridors is dominated by reed canary grass, which has a stability rating of 9.
Success	The intent of the stream restoration is to allow the stream to naturally migrate within the floodplain and to give it enough room to move and stabilize itself within the site.	Y	The stream has plenty of space within the floodplain for natural migration. The stream currently appears to be stable with no lateral adjustment observed following construction.
Stream Bank Vegetation	Banks are vegetated with a majority of deep-rooting riparian plant species that have rootstability indices of 6 or greater.	Y	Reed canary grass and foxtail (<i>Alopecurus</i> sp.) dominate the stream banks. Reed canary grass has a root-stability index of 9. Alopecurus species found at the site have root stability index values of 3 for short-awn meadow foxtail and 4 for Garrison creeping foxtail.
Open Water	The project will provide open water during the spring and early summer within excavated depressions. As the growing season progresses and the groundwater levels recede, vegetation is anticipated to germinate within the majority of the depressions. Open water with submerged and/or floating vegetation will, therefore, be considered successful and creditable.	Y	Excavated depressions within the upper reach of the site experience seasonal drawdown, and rooted hydrophytic vegetation development has been observed. The lower depressions appear to support perennial inundation with established aquatic macrophyte community.
	Noxious weeds do not exceed 5 percent cover within upland buffer area.	Y	Noxious weed cover is less than 5 percent within the upland buffer.
Upland Buffer	Any area disturbed within the creditable buffer zone must have at least 50 percent aerial cover of nonweed species by the end of the monitoring period.	Y	Disturbed areas have established greater than 50 percent cover by nonweed species.
Weed Control	Weed control will be based on annual site monitoring to determine weed species and degree of infestation within the site. Control measures based on the monitoring results will be implemented by MDT to minimize and/or eliminate the intrusion of state-listed noxious weed species within the site.	Y	State-listed noxious weed species across the site have been monitored and mapped during each post-construction monitoring event. MDT administers an ongoing weed-control program.

- 4. Perennial Spring Channel Ditch was originally a drainage ditch constructed to relocate flows from a natural spring that emanates from the hillside in the south central portion of the site. At the suggestion of the MFWP fisheries biologist for this region, the ditch was reconstructed into a natural channel and connected to Coyote Creek to contribute perennial flow to Coyote Creek.
- 5. Lower Coyote Creek is the segment of stream at the southeast portion of the MDT property where Schrieber Creek previously merged with Coyote Creek before being relocated. The Coyote Creek stream flow is perennial through this segment.

Completely restoring sinuosity and stream length to both Coyote Creek and Schrieber Creek was intended to create a new channel length of approximately 7,756 linear feet, which is an overall increase of 3,327 linear feet from the previously channelized length of 4,429 linear feet. As part of the Montana Stream Mitigation Procedure [USACE, 2010b], calculating stream mitigation credits includes summing both riparian (provided in Table 3-10) and stream credits (provided in Table 3-11).

Table 3-10. Determination of Riparian Mitigation Credits for Schrieber Meadows

Factors	Upper Coyote Creek (USFS)	Coyote Creek Spring Area	Middle Coyote Creek (MDT)	Perennial Spring Channel	Lower Coyote Creek
Net Improvement – Stream Side A	0.25	0.40	0.25	0.25	0.25
Net Improvement – Stream Side B	0.25	0.40	0.25	0.25	0.25
Type of Protection	0.20	0.20	0.20	0.20	0.20
Mitigation Timing	0.10	0.10	0.10	0.10	0.10
Comparative Stream Order	0.20	0.20	0.20	0.20	0.20
Location	0.10	0.10	0.10	0.10	0.10
Sum of Factors (M)	1.10	1.40	1.10	1.10	1.10
Linear Feet (L)	1,752	190	3,179	400	2,425
Reach Multiplier (RM)	1.25	1.25	1.25	1.25	1.25
Total Riparian Credits (M × L × RM)	2,409	332	4,371	550	3,334
Total Riparian Credits = 10,996					

With the exception of the Coyote Creek spring area, which was undisturbed during construction activities, a net improvement factor of 0.25 for each side of the stream for the entire site was used for the riparian credit calculation. This value was based on the minimum creditable riparian width of 25 feet on either side of the new stream channel (50 feet total) to minimize conflict with proposed wetland credit areas. A protection factor of 0.20 was used based on the federal and state agency ownership of the site and executed conservation easement. A mitigation timing factor of 0.10 was used based on the development of the stream credits before any impact debits. To determine the comparative stream order factor for each segment, a same order factor of 0.20 was used. Because the developed mitigation credits will likely be used to offset impacts within the watershed more than 0.5 mile away, the off-site factor of 0.10 was used.

Table 3-11. Determination of Stream Mitigation Credits for Schrieber Meadows

Factors	Upper Coyote Creek (USFS)	Coyote Creek Spring Area	Middle Coyote Creek (MDT)	Perennial Spring Channel	Lower Coyote Creek
Net Improvement	2.50	0.00	2.50	2.50	2.50
Stream Status	0.05	0.05	0.05	0.05	0.05
Type of Protection	0.20	0.20	0.20	0.20	0.20
Mitigation Timing	0.10	0.10	0.10	0.10	0.10
Comparative Stream Order	0.20	0.20	0.20	0.20	0.20
Location	0.10	0.10	0.10	0.10	0.10
Sum of Factors (M)	3.15	0.65	3.15	3.15	3.15
Linear Feet (L)	1,752	190	3,179	400	2,425
Total Stream Credits (M × L)	5,519	123	10,014	1,260	7,639
Total Stream Credits = 24,555					
Total Mitigation Cre	edits (Ripariar	n + Stream) =	= 10,996 + 2	4,555 = 35,55°	1

To determine the stream credits for the Coyote and Schrieber Creek corridors, many of the same factors that were used in the riparian credit calculations were repeated. The only exception was the net improvement factor for stream credits, where a factor of 2.5 for substantial improvement was assigned. No net improvement factor for the Coyote Creek spring area was included because this area was not constructively changed.

The stream credits that are reported here are based on the designed stream lengths, as presented in the project plan sheets (Appendix E). With the exception of woody plant survival criteria, the site has achieved the riparian buffer success and channel-restoration success criteria to date. Both the stream channel and creditable buffer areas have greater than 70 percent aerial cover by deep-rooting vegetation and less than 10 percent cover by state-listed noxious weeds. The construction technique employed for creating the new channels did not disturb the stream banks, which are predominantly covered by reed canary grass (plant stability rating of 9). The riparian success criteria that pertain to woody plant survival of greater than 50 percent after 5 years has not been achieved. An approximate 5 percent survival rate for the planted woody species was estimated based on ocular review of the site in 2018. The 35,551 stream credits that were calculated for this site after construction achieves the goals for the stream mitigation component of the Schrieber Meadows project.

The restored channel has met the defined success criteria by supporting deep-rooted vegetation along the stream banks and a floodplain capable of supporting lateral migration within the site. The riparian buffer has achieved the success criteria associated with developing greater than 70 percent vegetation cover while supporting less than 10 percent cover by noxious weeds. However, the success criteria that indicate 50 percent survival of planted trees and shrubs after 5 years has not been achieved. Higher-than-expected water levels across the site and perennial inundation appear to inhibit the survival and development of woody species within the site. No woody communities were identified within the site in 2018. Viewing the small shrubs throughout much of the site was made difficult by the robust reed canary grass.

			nimum, establish a transect at the windward and leeward sides of ventory, representative portions of the wetland site.
Comments:	_		

PHOTOGRAPHS

Take photographs of the following permanent reference points listed in the check list below. Record the direction of the photograph using a compass. When at the site for the first time, establish a permanent reference point by setting a ½ inch rebar or fencepost extending 2-3 feet above ground. Survey the location with a resource grade GPS and mark the location on the aerial photograph.

GPS SURVEYING

Using a resource grade GPS survey the items on the checklist below. Collect at least 3 location points set at a 5 second recording rate. Record file numbers for site in designated GPS field notebook.

 GPS Checklist: □ Upland/wetland boundary. □ 4-6 landmarks that are recognizable on the aerial photograph. □ Start and End points of vegetation transect(s). □ Photograph reference points. □ Groundwater monitoring well locations. □ Bird nest boxes.
Comments / Problems:
WETLAND DELINEATION (attach COE delineation forms)
At each site conduct these checklist items: Delineate wetlands according to the 1987 Army COE manual and regional supplement. Delineate wetland – upland boundary onto aerial photograph.
Comments / Problems:
FUNCTIONAL ASSESSMENT Complete and attach full MDT Montana Wetland Assessment Method field forms.
Comments / Problems:
MAINTENANCE
Were man-made nesting structure installed at this site? <u>Yes</u> If yes, do they need to be repaired? <u>No</u> If yes, describe the problems below and indicate if any actions were taken to remedy the problems.
if yes, describe the problems below and indicate if any actions were taken to remedy the problems.
Were man-made structures built or installed to impound water or control water flow into or out of the wetland? <u>NA</u> If yes, are the structures working properly and in good working order? <u>NA</u> If no, describe the problems below.

	Slope	Emergent Wetland		Seasonal / Intermittent	55						
II.											
ľ											
-											

common 12. GENERAL CONDITION OF AA

i. Disturbance: Use matrix below to select the appropriate response; see manual for Montana listed noxious weed and aquatic nuisance vegetation species lists.

11. ESTIMATED RELATIVE ABUNDANCE (of similarly classified sites within the same Major Montana Watershed Basin; see manual.)

	Predominar	nt Conditions Adjacent to (within	500 feet of) AA
Conditions within AA	Managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or buildings; and noxious weed or ANVS cover is 15%.	Land not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to minor clearing; contains few roads or buildings; noxious weed or ANVS cover is 30%.	Land cultivated or heavily grazed or logged; subject to substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.
AA occurs and is managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or occupied buildings; and noxious weed or ANVS cover is 15%.			moderate disturbance
AA not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to relatively minor clearing, fill placement, or hydrological alteration; contains few roads or buildings; noxious weed or ANVS cover is 30%.			
AA cultivated or heavily grazed or logged; subject to relatively substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.			

Comments (types of disturbance, intensity, season, etc.): AA includes excavated depressions and adjacent undisturbed wetland habitat created as a result of higher water table. Highway 2 is adjacent to the AA.

- ii. Prominent noxious, aquatic nuisance, and other exotic vegetation species: Cirsium arvense and occasional Cynoglossum officinale.
- iii. Provide brief descriptive summary of AA and surrounding land use/habitat: AA includes constructed wetland depressions and adjacent wetland habitat that has been created by the plugging of existing ditches and channels, creation of a new stream channel and subsidence of the histosol soil elevations over time. The surrounding land is currently managed in a natural state. USFS land surrounds the majority of the site.

13. STRUCTURAL DIVERSITY (Based on number of "Cowardin" vegetated classes present [do not include unvegetated classes]; see #10 above.)

Existing # of "Cowardin" Vegetated Classes in AA	Initial Rating	Is current management peristence of additional		Modified Rating

YES

NO Comments:

Highway adjacent to the site.

Wetland/Site #(s): Creation

14	F. SHORT AND LONG TERM SURFACE WATER STORAGE
	Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.
	If no wetlands in the AA are subject to flooding or ponding, then check the NA box and proceed to 14G.
	Rating: Working from top to bottom, use the matrix below to select the functional point and rating. Abbreviations for surface water durations are as
	follows: P/P = permanent/perennial; S/I = seasonal/intermittent; and T/E = temporary/ephemeral [see manual for further definitions of these terms].

Estimated Maximum Acre Feet of Water Contained in Wetlands within the AA that are Subject to Periodic Flooding or Ponding		>5 acre fe	eet	□ 1.1	to 5 ac	re feet	☐ ≤1 acre foot		
Duration of Surface Water at Wetlands within the AA	⊠ P/P	□ S/I	□ T/E	□ P/P	□ S/I	□ T/E	□ P/P	□ S/I	□ T/E
Wetlands in AA flood or pond ≥ 5 out of 10 years	1H								
Wetlands in AA flood or pond < 5 out of 10 years									

Comments: Extensive areas of inundation were observed in 2013-2018.

14G.	SEDIMENT / NUTRIENT / TOXICANT / RETENTION AND REMOVAL
	Applies to wetland with potential to receive sediments, nutrients, or toxicants through influx of surface or ground water or direct input
	If no wetlands in the AA are subject to such input, check the NA box and proceed to 14H.

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating.

Sediment, Nutrient, and Toxicant Input Levels within AA	has potent nutrients, such that of substantia sedimenta	tial to delive or compou other funct ally impaire tion, source	er sedime inds at lev ions are n d. 11. ESTIMATED RELATIVE ABUNDANCE (of similarly classified sites within the same Major Montana Watershed Basin; see manual.) common

12. GENERAL CONDITION OF AA

i. Disturbance: Use matrix below to select the appropriate response; see manual for Montana listed noxious weed and aquatic nuisance vegetation species lists.

	Predominant Conditions Adjacent to (within 500 feet of) AA									
Conditions within AA	Managed in precominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or buildings; and noxious weed or ANUS cover is 15%.		Land cultivated or heavily grazed or logged; subject to substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.							
AA occurs and is managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or occupied buildings; and noxious weed or ANVS cover is 15%.			moderate disturbance							
AA not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to relatively minor clearing, fill placement, or hydrological alteration; contains few roads or buildings; noxious weed or ANVS cover is 30%.										
AA cultivated or heavily grazed or logged; subject to relatively substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.										

Comments (types of disturbance, intensity, season, etc.): Disturbance due to recent road fill between the AA and Hwy 2

- ii. Prominent noxious, aquatic nuisance, and other exotic vegetation species: Cirsium arvense
- iii. Provide brief descriptive summary of AA and surrounding land use/habitat: AA includes existing wetlands located between stream mitigation area and US Hwy 2. The wetland is dominated by reed canarygrass and meadow foxtail. Restoration efforts have resulted in increased inundation. Adjacent land use is forest and the highway.

13. STRUCTURAL DIVERSITY (Based on number of "Cowardin" vegetated classes present [do not include unvegetated classes]; see #10 above.)

Existing # of "Cowardin" Vegetated Classes in AA	Initial Rating	Is current management peristence of additional v		Modified Rating
3 (or 2 if one is forested) classes		NA	NA	NA
2 (or 1 if forested) classes		NA	NA	NA
1 class, but not a monoculture	mod	←NO	YES→	
1 class, monoculture (1 species comprises 90% of total cover)		NA	NA	NA

Comments: Emergent wetland dominated by reed canary grass and meadow foxtail with Carex spp. beginning to establish.

AA contains unrestricted outlet										

ii. Are 10 acres of wetland in the AA subject to flooding AND are man-made features which may be significantly damaged by floods located within 0.5 mile downstream of the AA?

YES

NO Comments:
AA inundated from restricted outlet, minimal trees or shrubs present.

14F.	4F. SHORT AND LONG TERM SURFACE WATER STORAGE $\ \square$ N.	A (proceed to 14G)
	Applies to wetlands that flood or pond from overbank or in-channel flow	, precipitation, upland surface flow, or groundwater flow.
	If no wetlands in the AA are subject to flooding or ponding, then check	the NA box and proceed to 14G.

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating. Abbreviations for surface water durations are as follows: P/P = permanent/perennial; S/I = seasonal/intermittent; and T/E = temporary/ephemeral [see manual for further definitions of these terms].

Estimated Maximum Acre Feet of Water Contained in Wetlands within the AA that are Subject to Periodic Flooding or Ponding		>5 acre fe	eet	□ 1.1	to 5 ac	re feet	☐ ≤1 acre foot		
Duration of Surface Water at Wetlands within the AA	⊠ P/P	□ S/I	□ T/E	□ P/P	□ S/I	□ T/E	□ P/P	□ S/I	□ T/E
Wetlands in AA flood or pond ≥ 5 out of 10 years	1H								
Wetlands in AA flood or pond < 5 out of 10 years									

Comments: AA includes constructed wetland depressions and adjacent wetland habitat that has been created by the Inundation due to restoration efforts including: plugging of existing ditches and channels and creation of a new stream channel.

Applies to wetland with potential to receive sediments, nutrients, or toxicants through influx of surface or ground water or direct input. If no wetlands in the AA are subject to such input, check the NA box and proceed to 14H.

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating.

Sediment, Nutrient, and Toxicant Input Levels within AA	AA receive has potent nutrients, such that a substantia sedimenta toxicants, present.	tial to deliv or compou other funct Illy impaire tion, sourc	er sedime inds at lev ions are n d. 	HGM Class (Brinson)	Class (Cowardin)	Modifier (Cowardin)	Water Regime	% OF AA
	Depressional	Aquatic Bed	Excavated	Permanent / Perennial	35
	Depressional	Emergent Wetland	Excavated	Seasonal / Intermittent	65

Comments: Mix of aquatic bed and emergent wetland

11. ESTIMATED RELATIVE ABUNDANCE (of similarly classified sites within the same Major Montana Watershed Basin; see manual.) common

12. GENERAL CONDITION OF AA

i. Disturbance: Use matrix below to select the appropriate response; see manual for Montana listed noxious weed and aquatic nuisance vegetation species lists.

	Predominar	nt Conditions Adjacent to (within	500 feet of) AA
Conditions within AA	Managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or buildings; and noxious weed or ANVS cover is 15%.	Land not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to minor clearing; contains few roads or buildings; noxious weed or ANVS cover is 30%.	Land cultivated or heavily grazed or logged; subject to substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.
AA occurs and is managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or occupied buildings; and noxious weed or ANVS cover is 15%.	low disturbance		
AA not cultivated, but may be moderately grazed or hayed or selectively logged; or has been subject to relatively minor clearing, fill placement, or hydrological alteration; contains few roads or buildings; noxious weed or ANVS cover is 30%.			
AA cultivated or heavily grazed or logged; subject to relatively substantial fill placement, grading, clearing, or hydrological alteration; high road or building density; or noxious weed or ANVS cover is >30%.			

Comments (types of disturbance, intensity, season, etc.): The adjacent Creation AA encompasses the excavated depressions constructed in 2007 and 2011. Highway 2 is close to the AA.

- ii. Prominent noxious, aquatic nuisance, and other exotic vegetation species: Cirsium arvense, Leucanthemum vulgare, Hieracium aurantiacum
- iii. Provide brief descriptive summary of AA and surrounding land use/habitat: The AA includes pre-existing wetlands identified within the project area that were modified by excavation to increase the groundwater availability and provide a greater diversity of wetland habitat and hydrophytes.

13. STRUCTURAL DIVERSITY (Based on number of "Cowardin" vegetated classes present [do not include unvegetated classes]; see #10 above.)

Existing # of "Cowardin" Vegetated Classes in AA	Initial Rating	Is current management peristence of additional		Modified Rating
3 (or 2 if one is forested) classes		NA	NA	NA
2 (or 1 if forested) classes	mod	NA	NA	NA
1 class, but not a monoculture		←NO	YES→	
1 class, monoculture (1 species comprises 90% of total cover)		NA	NA	NA

Comments: Emergent and aquatic bed

Comments: Good habitat diversity with substantial wildlife evidence.

Wetland/Site #(s): Restoration

14F.	SHORT AND LONG TERM SURFACE WATER STORAGE NA (proceed to 14G)
	Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.
	If no wetlands in the AA are subject to flooding or ponding, then check the NA box and proceed to 14G.

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating. Abbreviations for surface water durations are as follows: P/P = permanent/perennial; S/I = seasonal/intermittent; and T/E = temporary/ephemeral [see manual for further definitions of these terms].

Estimated Maximum Acre Feet of Water Contained in Wetlands within the AA that are Subject to Periodic Flooding or Ponding		>5 acre fe	eet	⊠ 1 .1	to 5 ac	re feet	☐ ≤1 acre foot			
Duration of Surface Water at Wetlands within the AA	□ P/P	□ S/I	□ T/E	⊠ P/P	□ S/I	□ T/E	□ P/P	□ S/I	□ T/E	
Wetlands in AA flood or pond ≥ 5 out of 10 years				.8H						
Wetlands in AA flood or pond < 5 out of 10 years										

Comments: AA with evidence of frequent flooding.

14G.	SEDIMENT / NU	JTRIENT / TO	OXICANT /	RETENTION	AND REMOVAL	□ NA (proceed to	14H
------	---------------	--------------	-----------	-----------	-------------	--------	------------	-----

Applies to wetland with potential to receive sediments, nutrients, or toxicants through influx of surface or ground water or direct input. If no wetlands in the AA are subject to such input, check the NA box and proceed to 14H.

i. Rating: Working from top to bottom, use the matrix below to select the functional point and rating.

Sediment, Nutrient, and Toxicant Input Levels within AA	AA receive has potent nutrients, such that e substantia sedimenta toxicants, present.	tial to delive or compou other funct ally impaire tion, source	er sedime inds at lev ions are n d.
